4 Every planned regression

Each population basis is fixed at its adjustment-complete BMI percentiles 5, 35, 65 and 95; age remains linear. No automatic estimator substitution, category pooling or model selection occurs. Model-based intervals condition on the empirical reference. Apparent fit is assessed on training data. Influence flags do not remove patients.

quantile type: 7; status: resolved; basis: splines::ns; intercept FALSE; 3 columns.

Table 672: Fixed spline basis

Complete model diagnostics

Training N = 71,318; events = 32,990; in-sample diagnostics

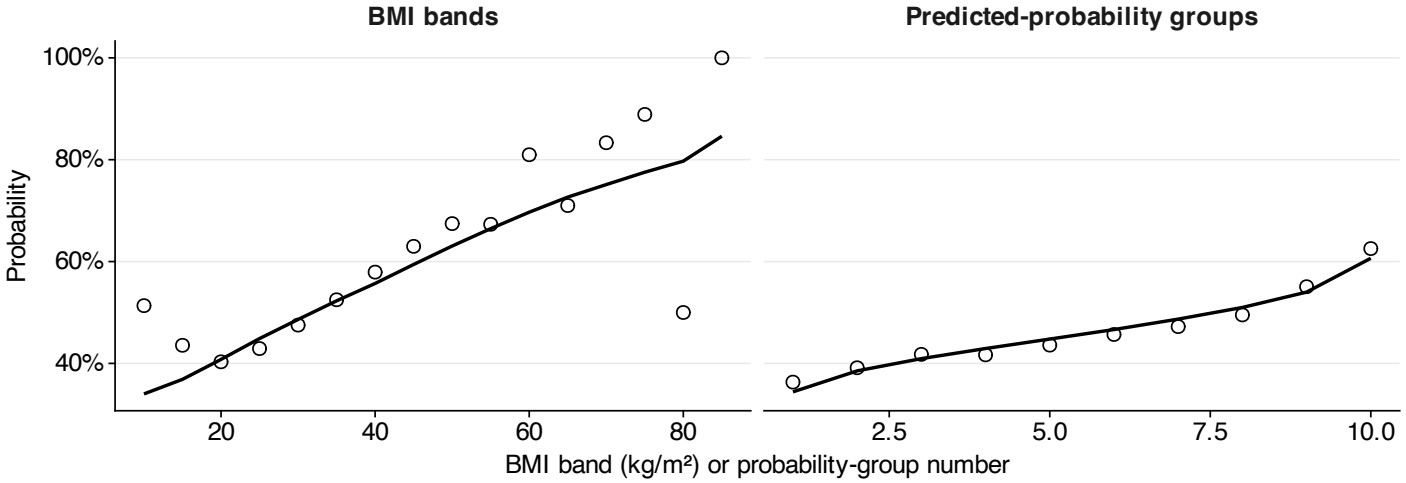
Model: abg/encounter/linear

Open points: observed means; line: fitted means



Residual and predicted-probability distributions

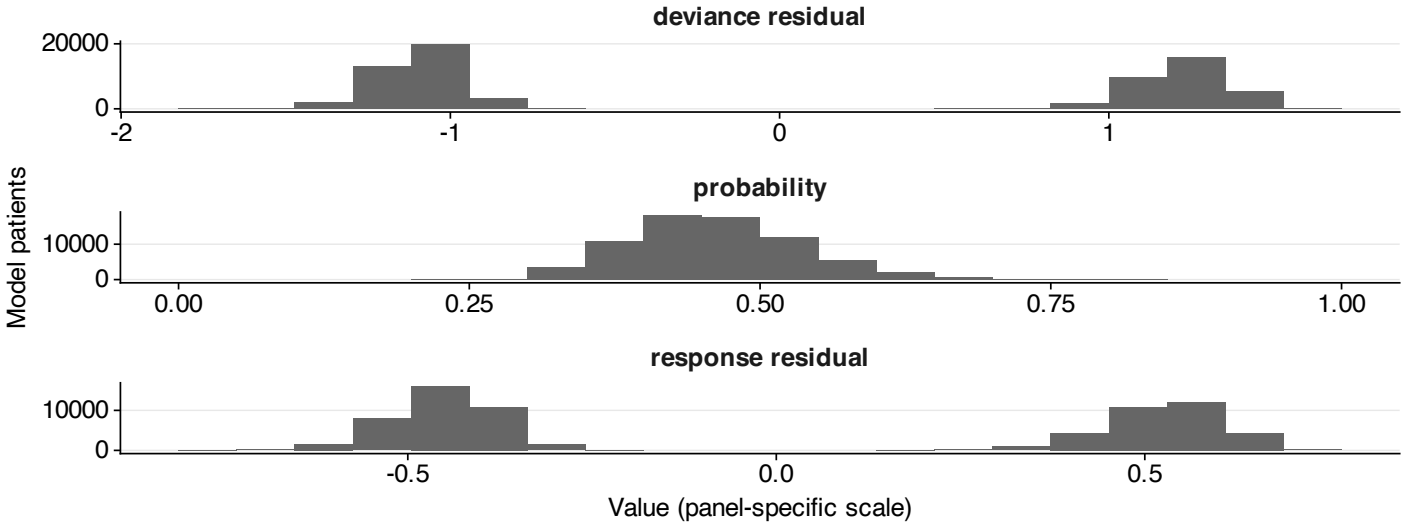


Figure 610: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model abg/encounter/linear apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

4.3 Model: primary::any_gas/encounter/spline

Complete model diagnostics

Training N = 126,074; events = 51,700; in-sample diagnostics

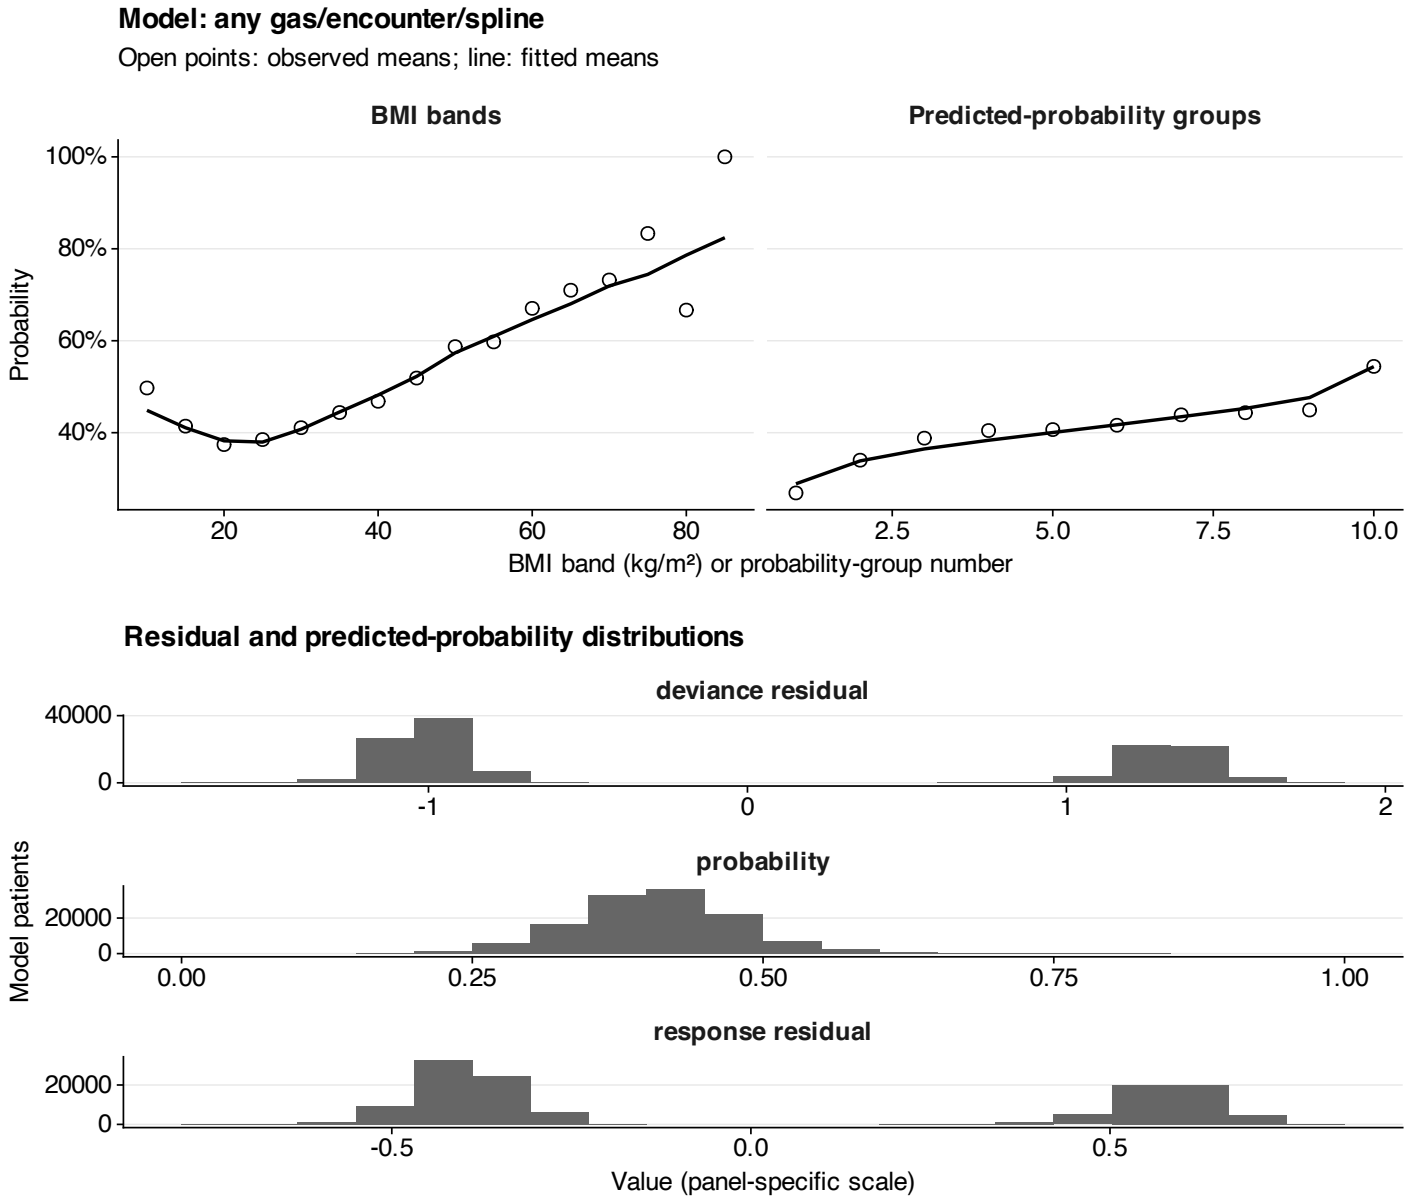

Figure 611: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model any_gas/encounter/spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 126,074; events = 51,700; in-sample diagnostics

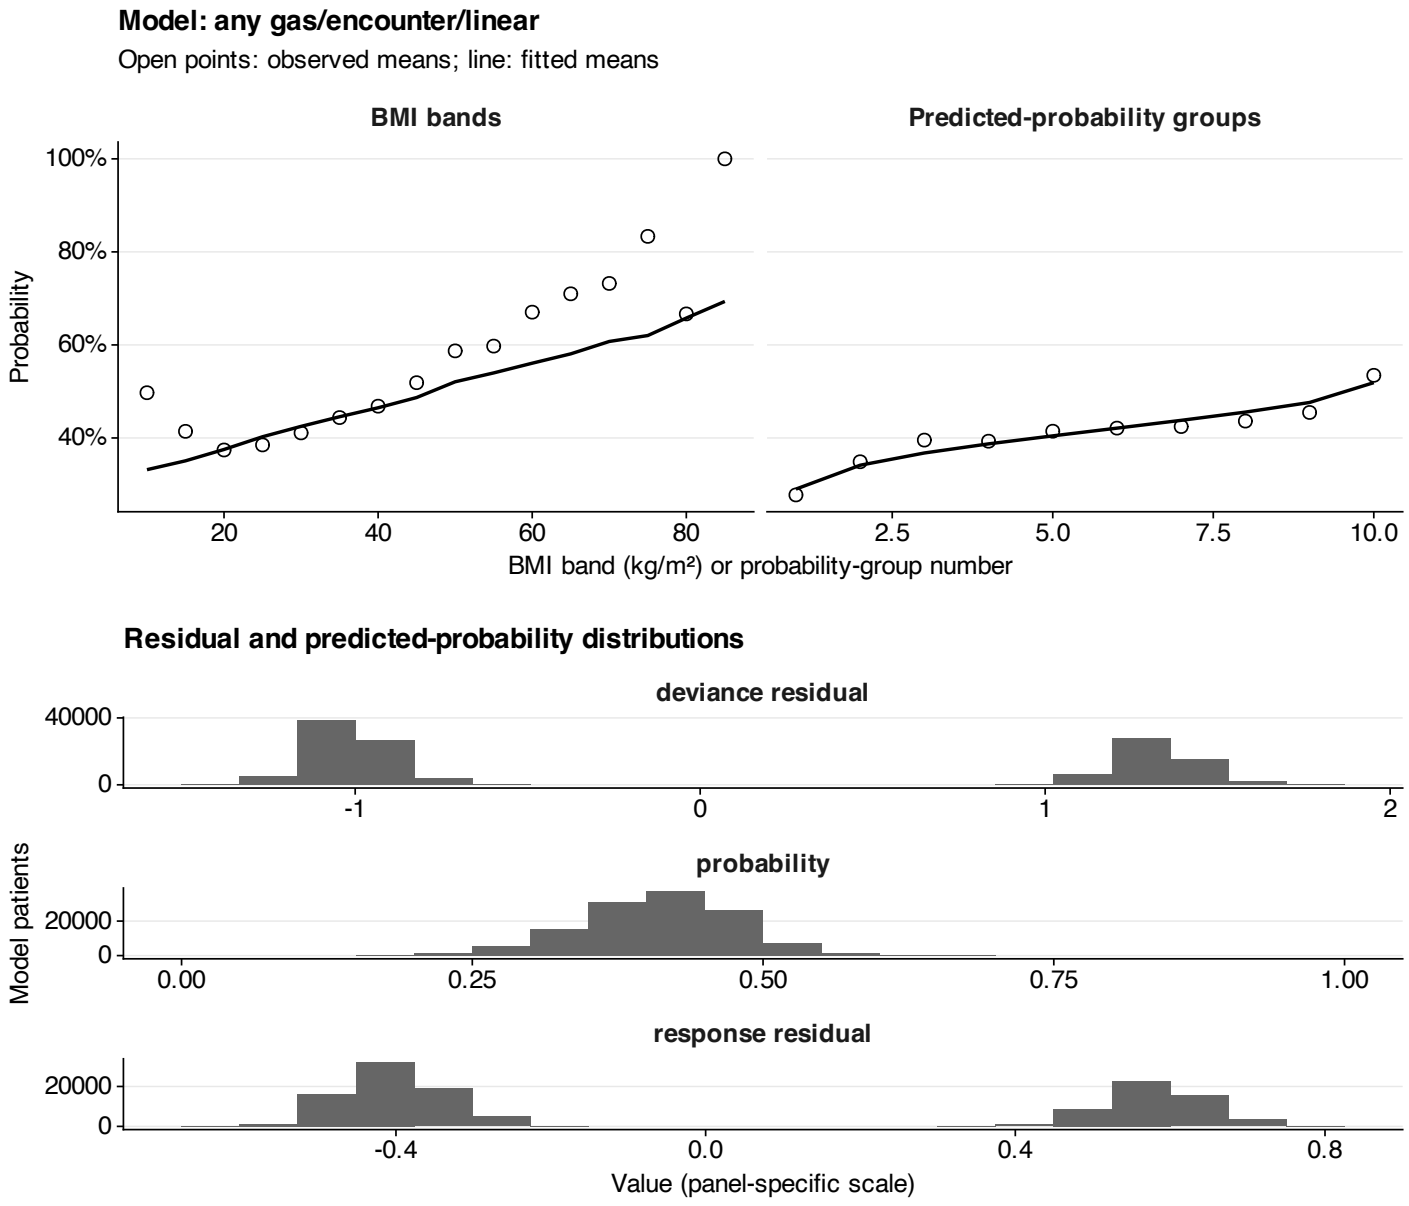

Figure 612: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model any_gas/encounter/linear apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 380,206; events = 16,063; in-sample diagnostics

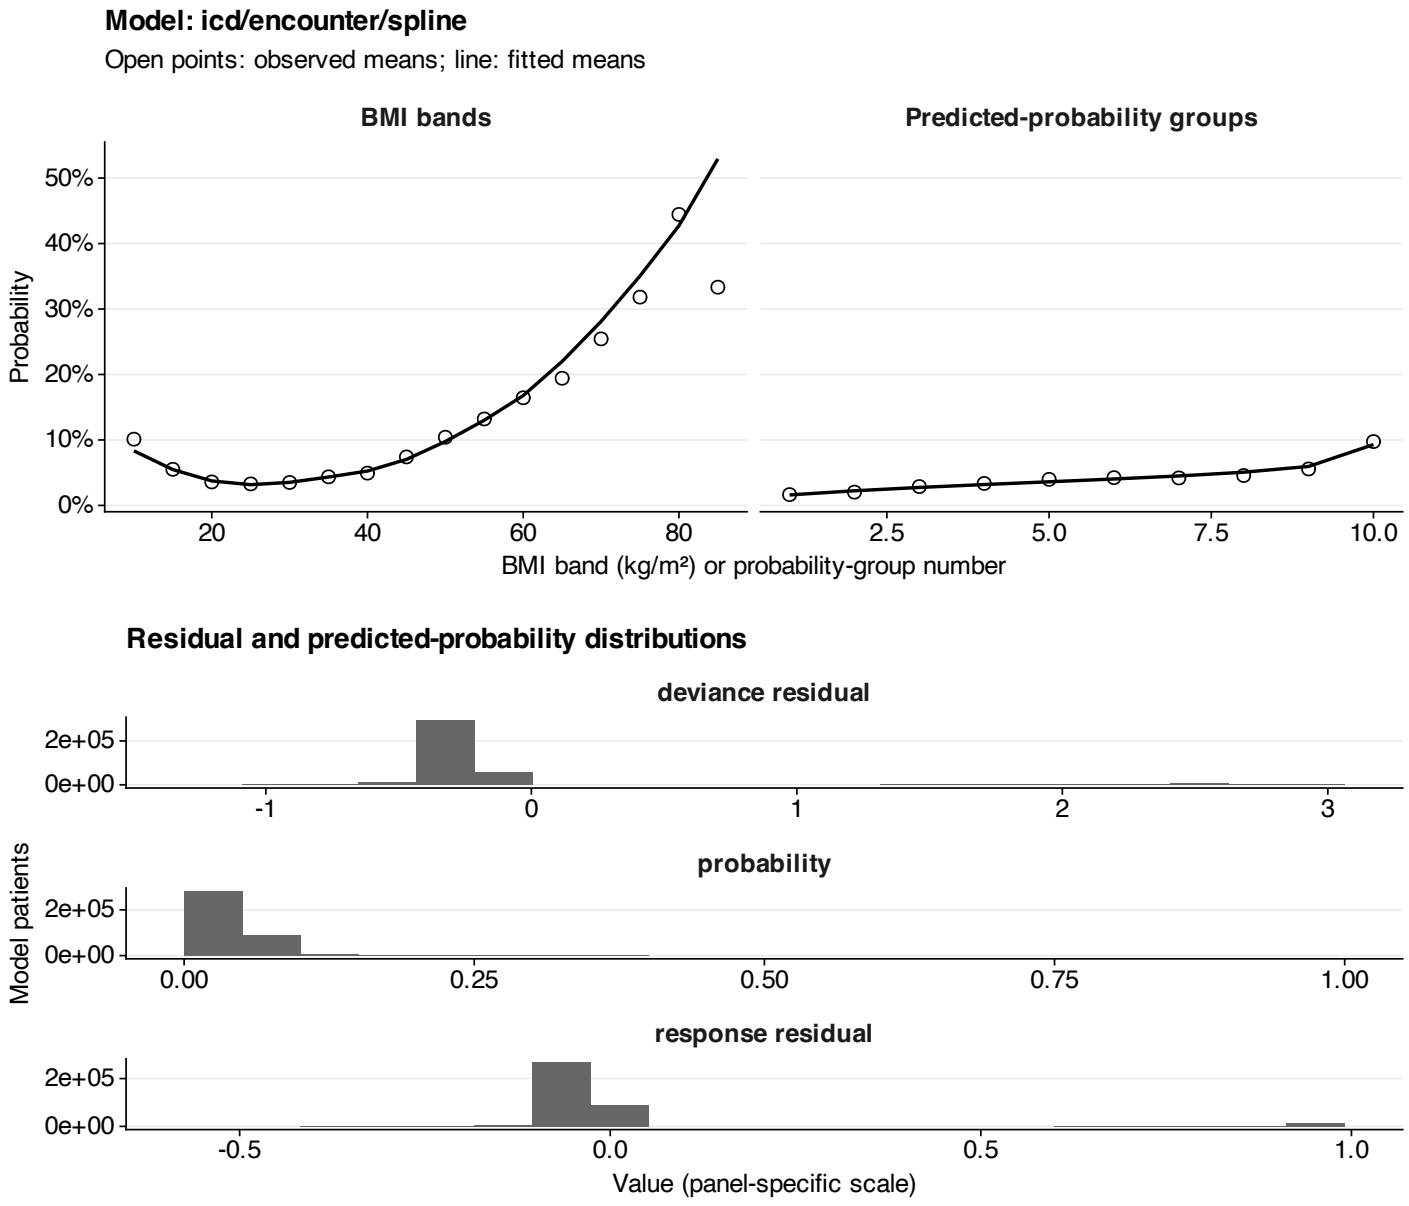

Figure 613: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model icd/encounter/spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 380,206; events = 16,063; in-sample diagnostics

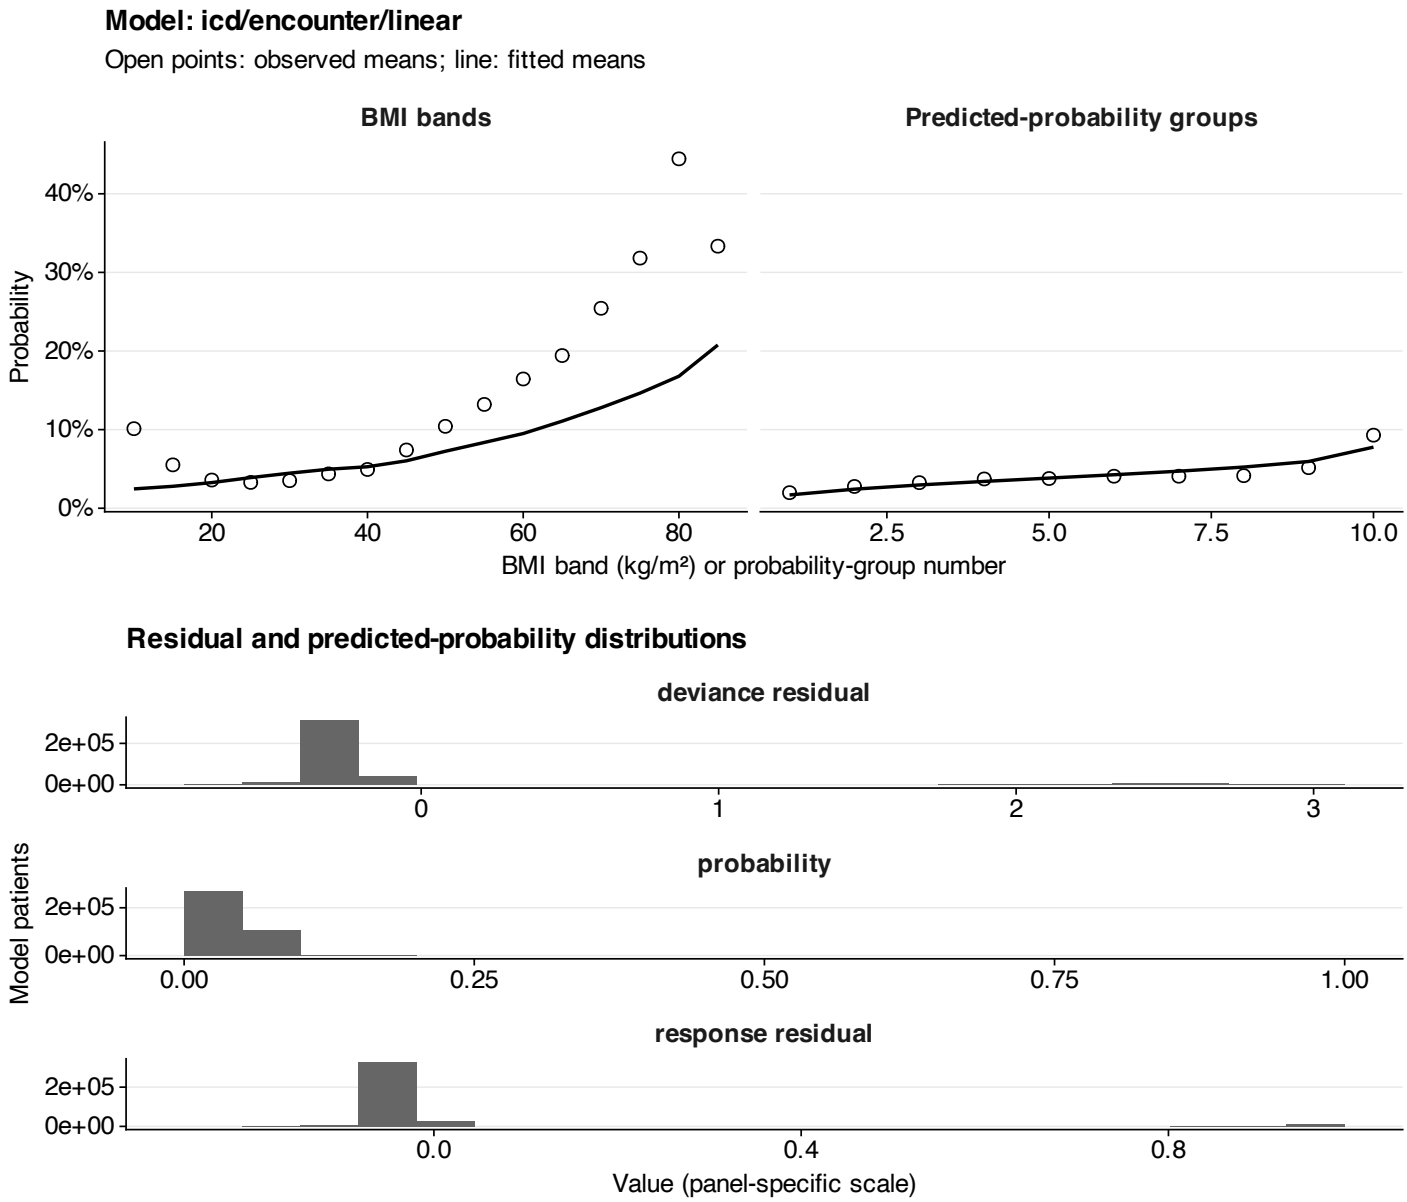

Figure 614: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model icd/encounter/linear apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 41,785; events = 17,196; in-sample diagnostics

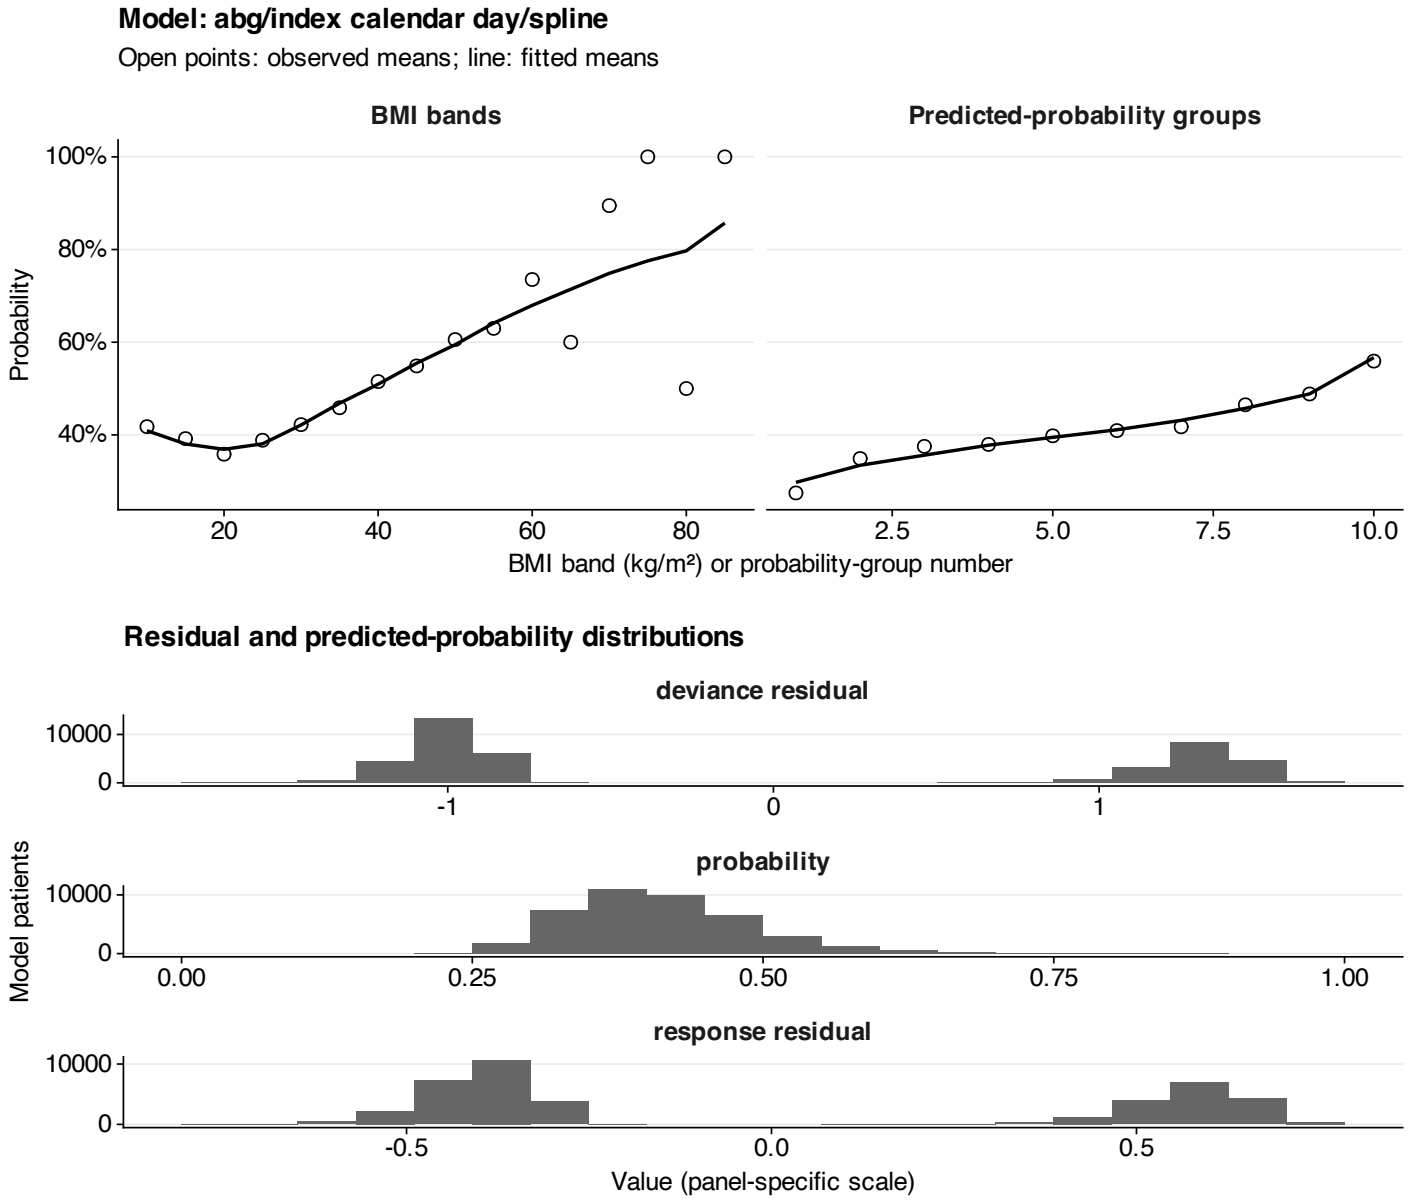

Figure 615: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model abg/index_calendar_day/spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

4.8 Model: primary::abg/index_calendar_day/linear

Complete model diagnostics

Training N = 92,324; events = 33,748; in-sample diagnostics

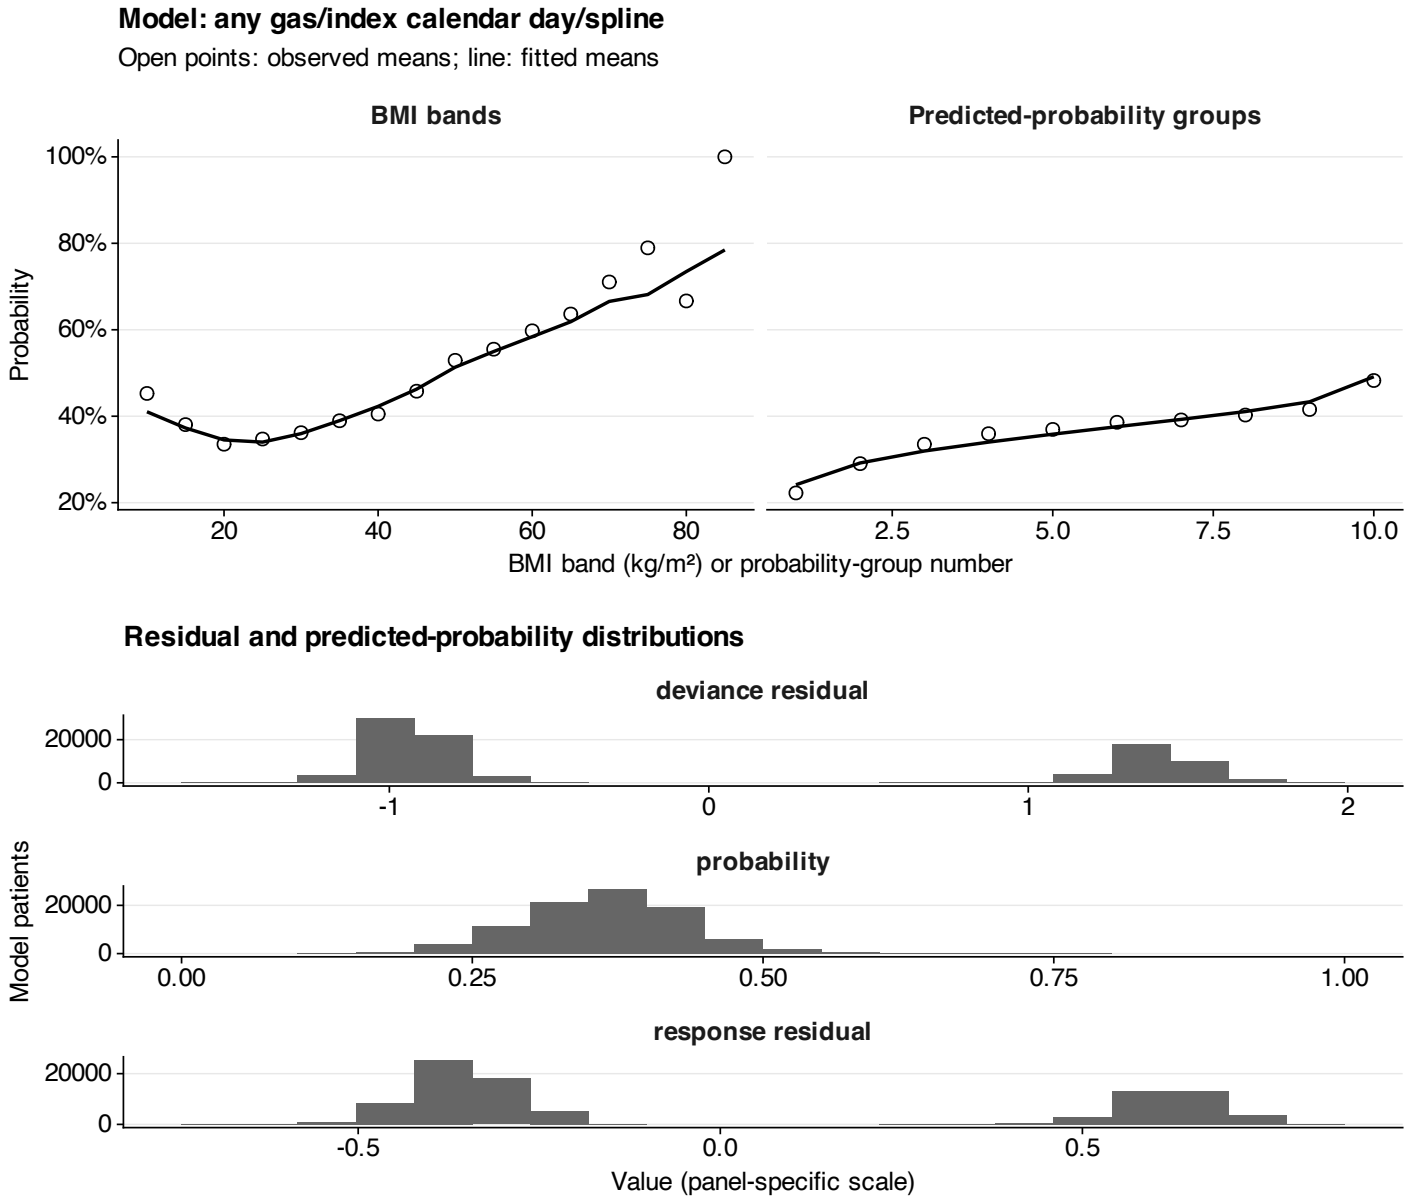

Figure 617: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model any_gas/index_calendar_day/spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 92,324; events = 33,748; in-sample diagnostics

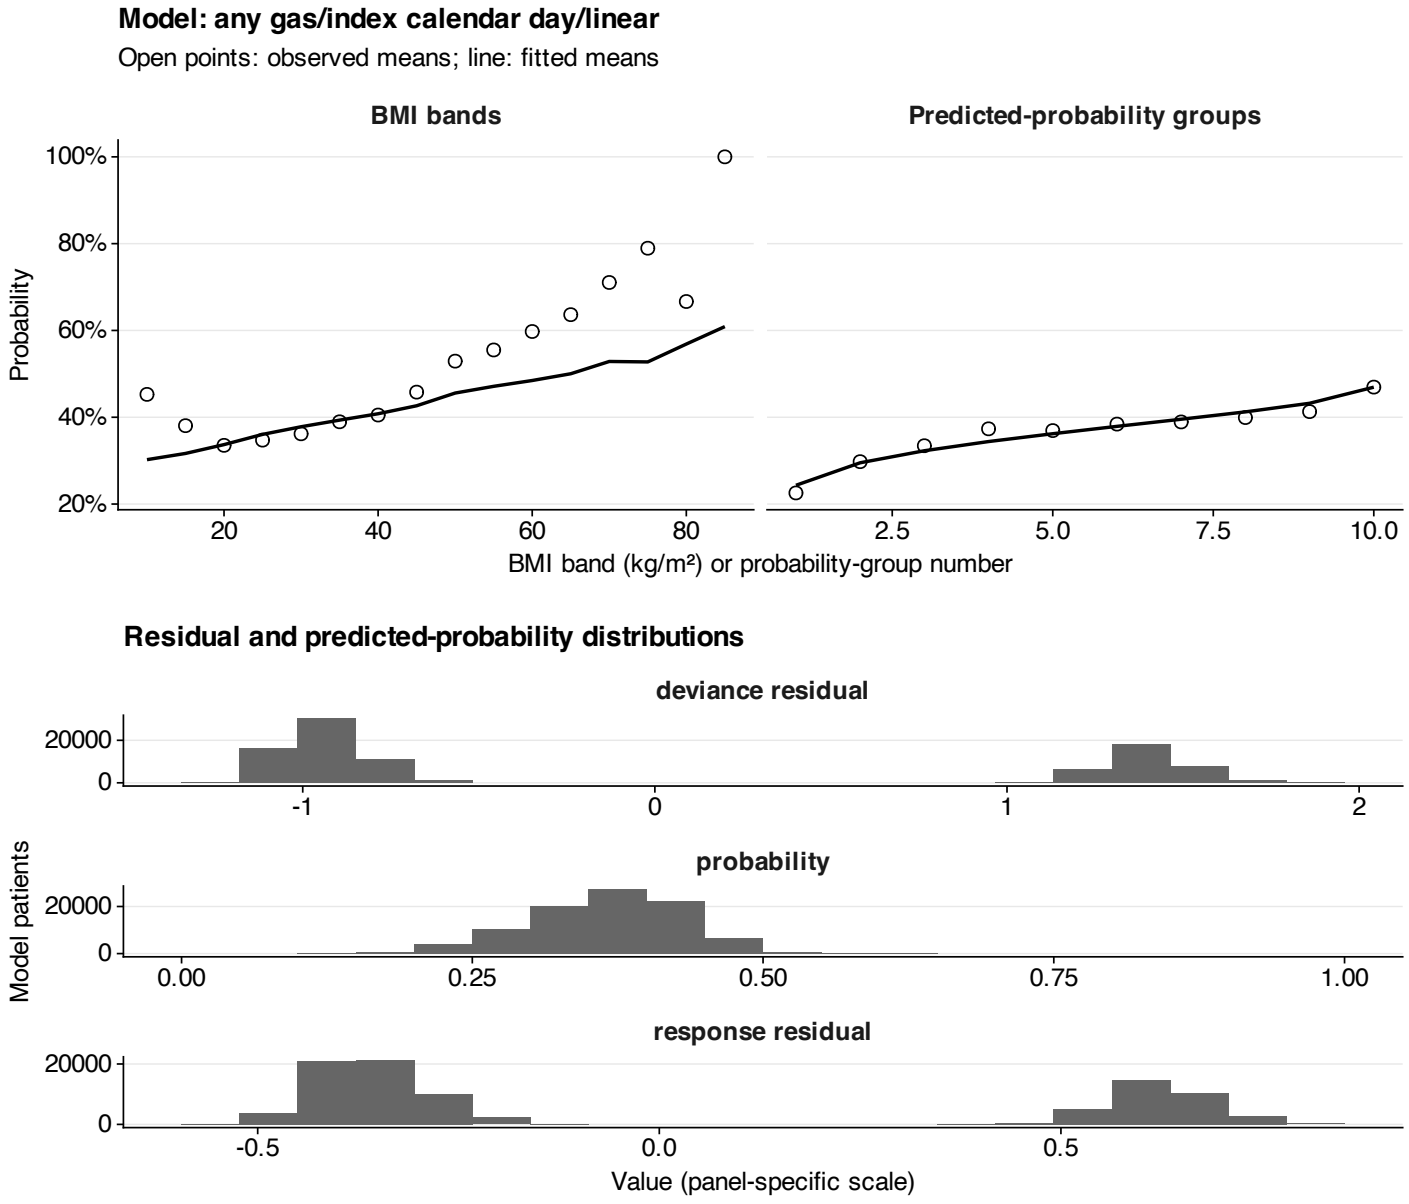

Figure 618: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model any_gas/index_calendar_day/linear apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 380,206; events = 71,318; in-sample diagnostics

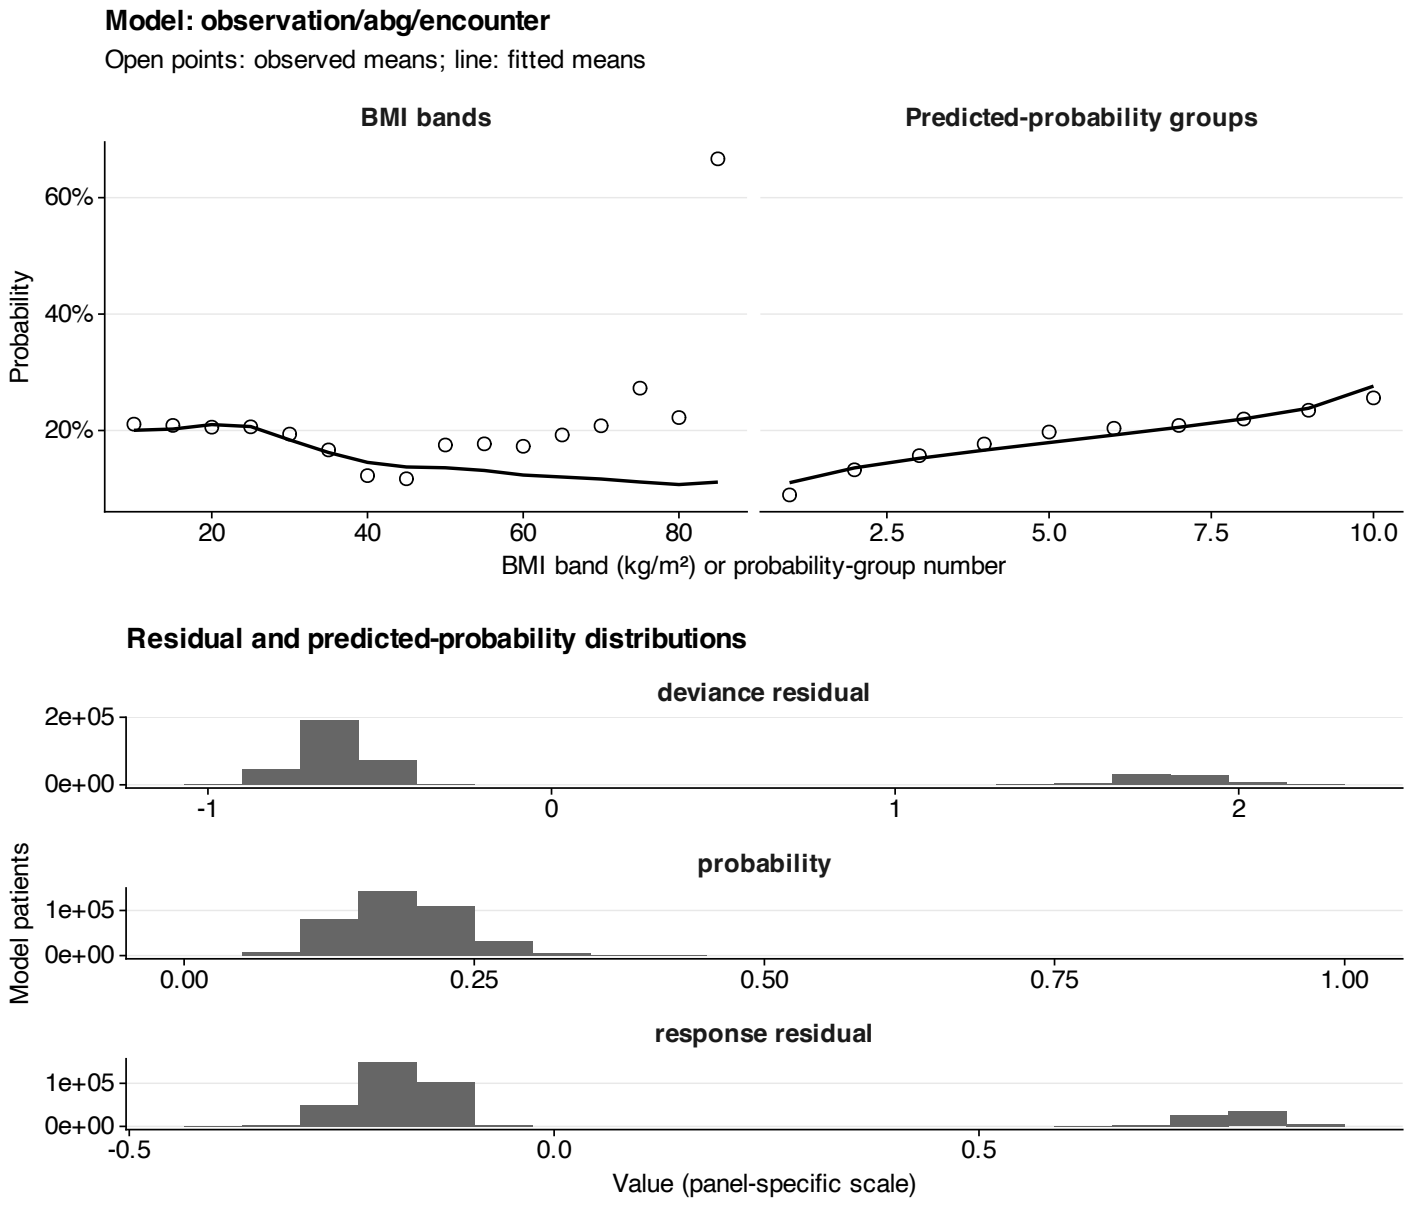

Figure 619: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model observation/abg/encounter apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 380,206; events = 74,346; in-sample diagnostics

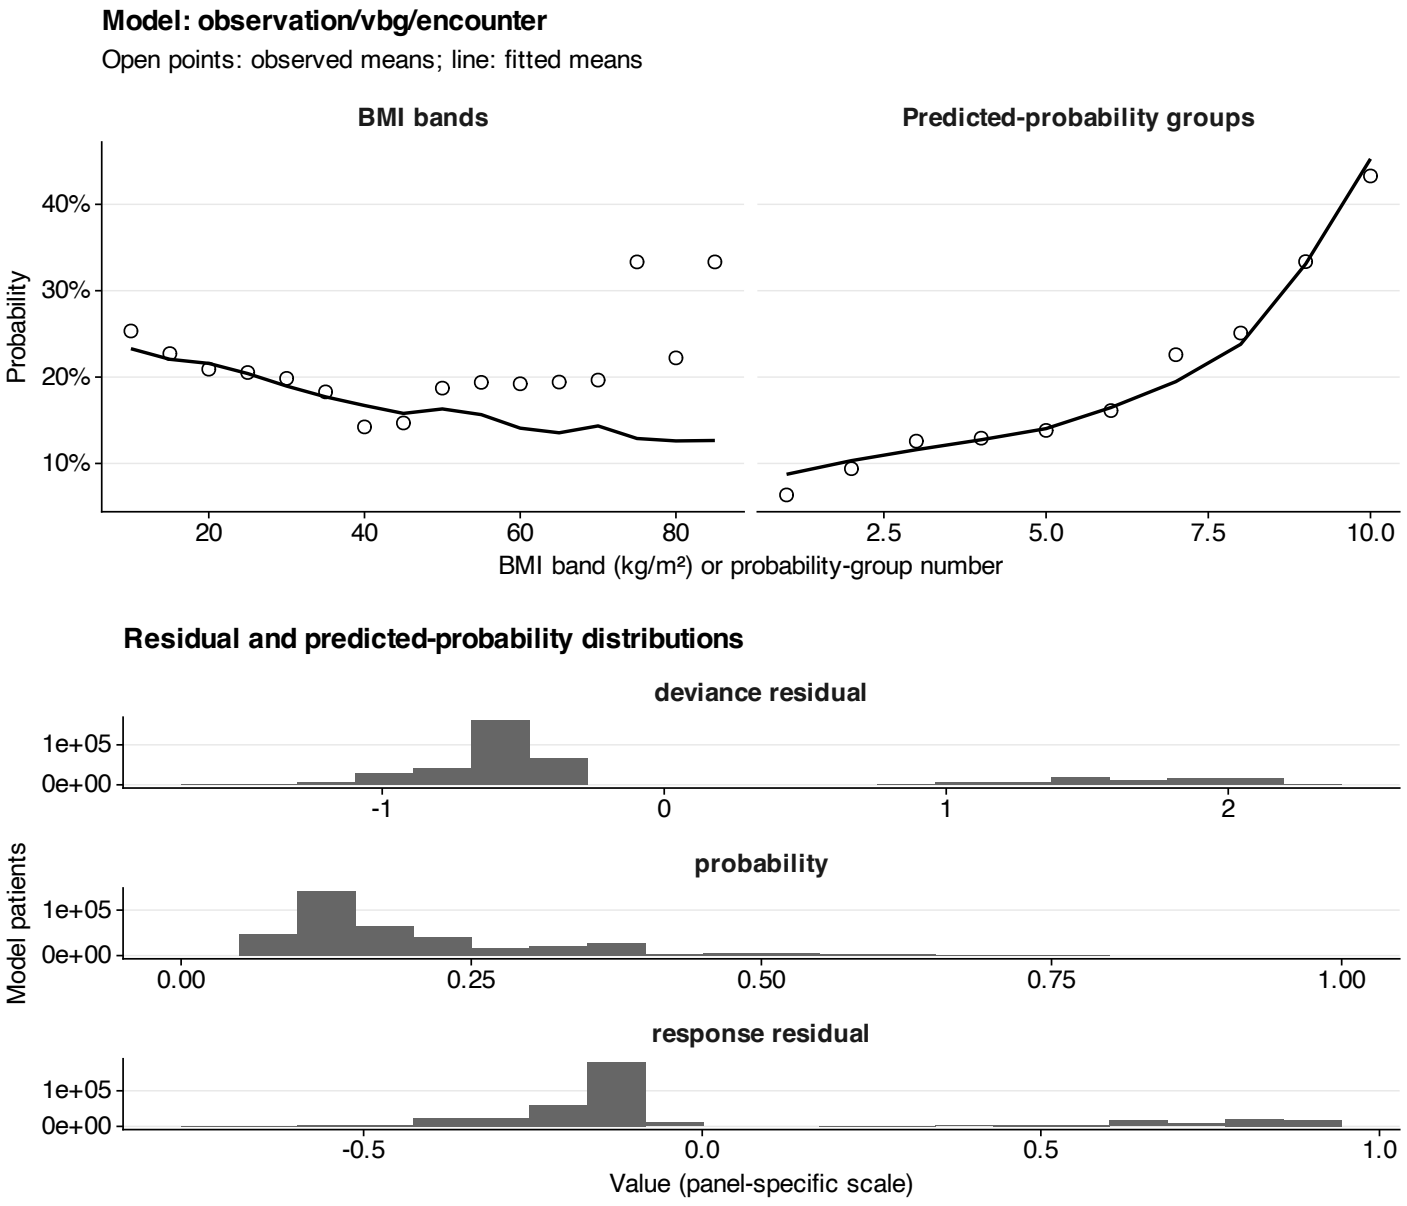

Figure 620: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model observation/vbg/encounter apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 380,206; events = 41,785; in-sample diagnostics

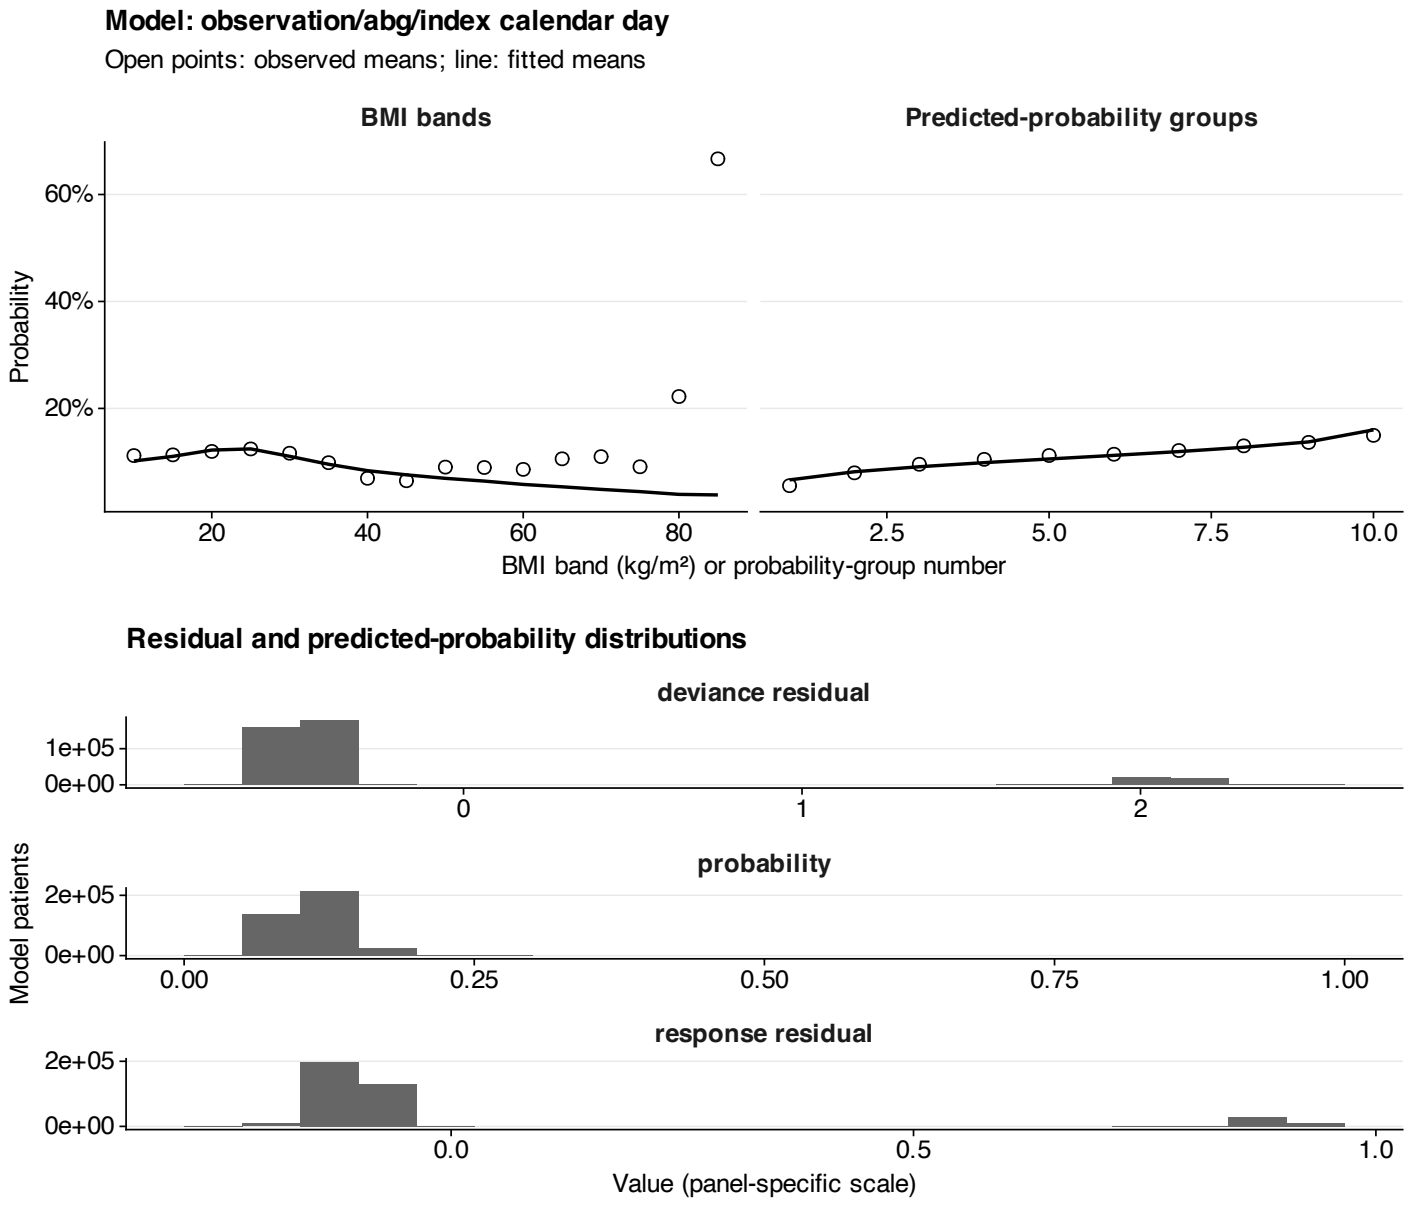

Figure 623: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model observation/abg/index_calendar_day apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 380,206; events = 92,324; in-sample diagnostics

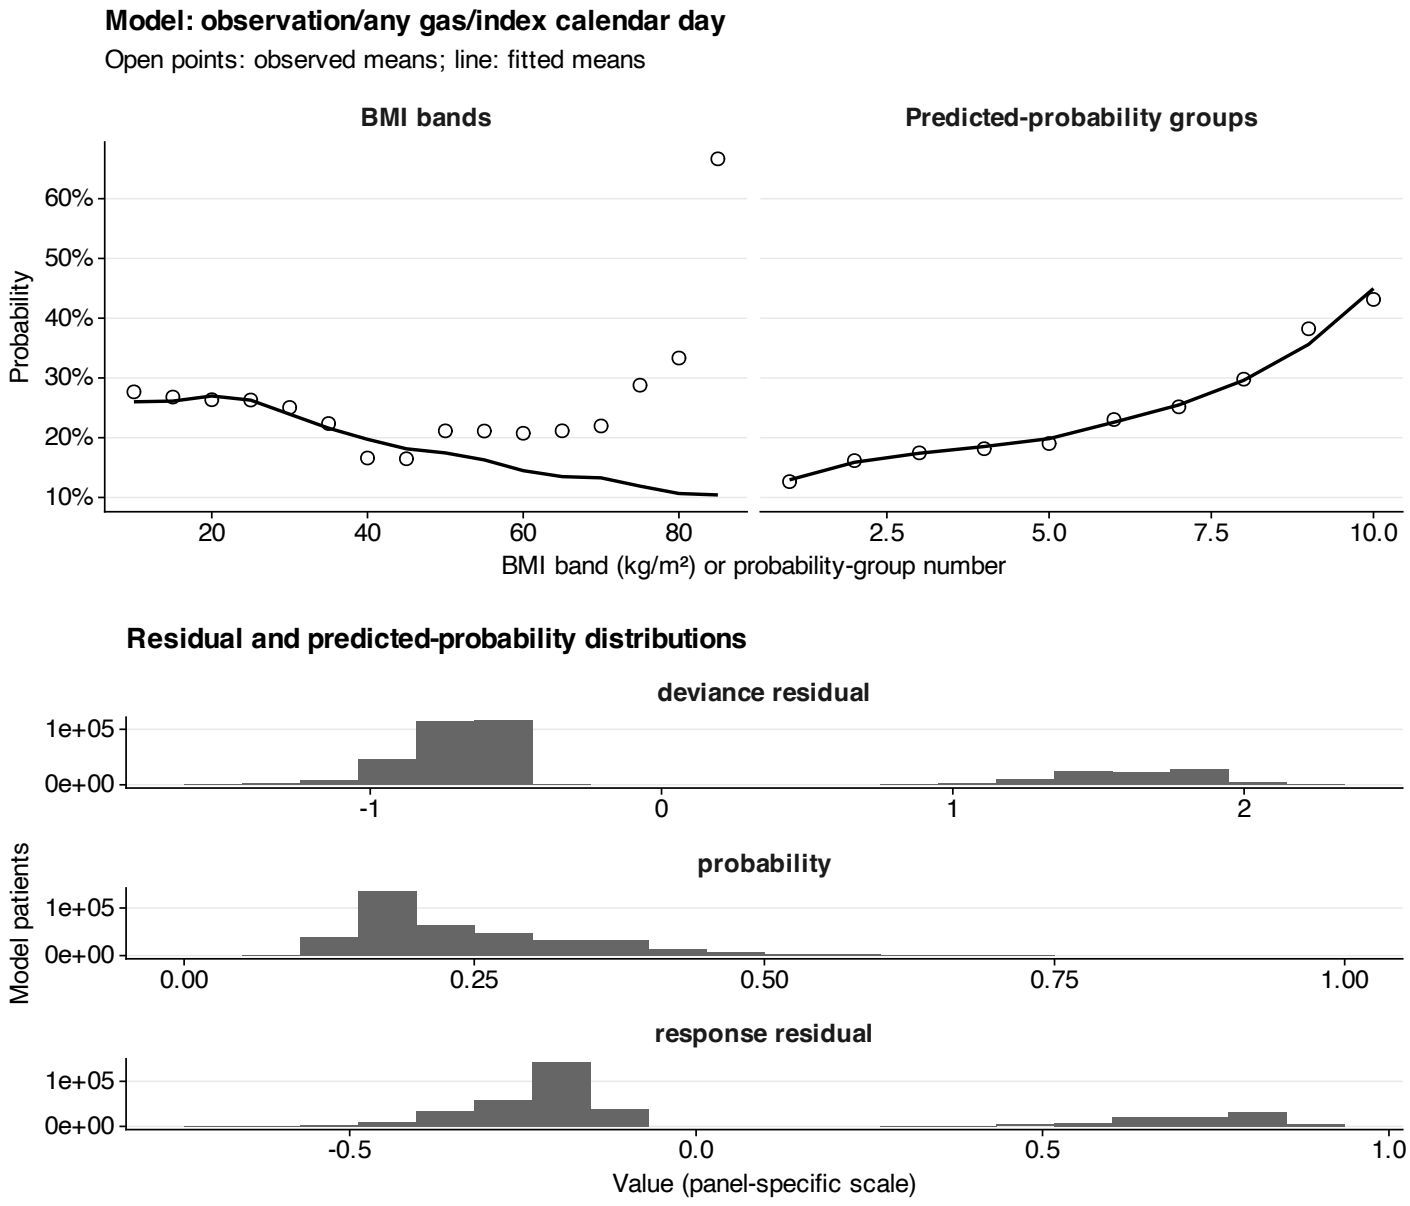

Figure 625: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model observation/any_gas/index_calendar_day apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

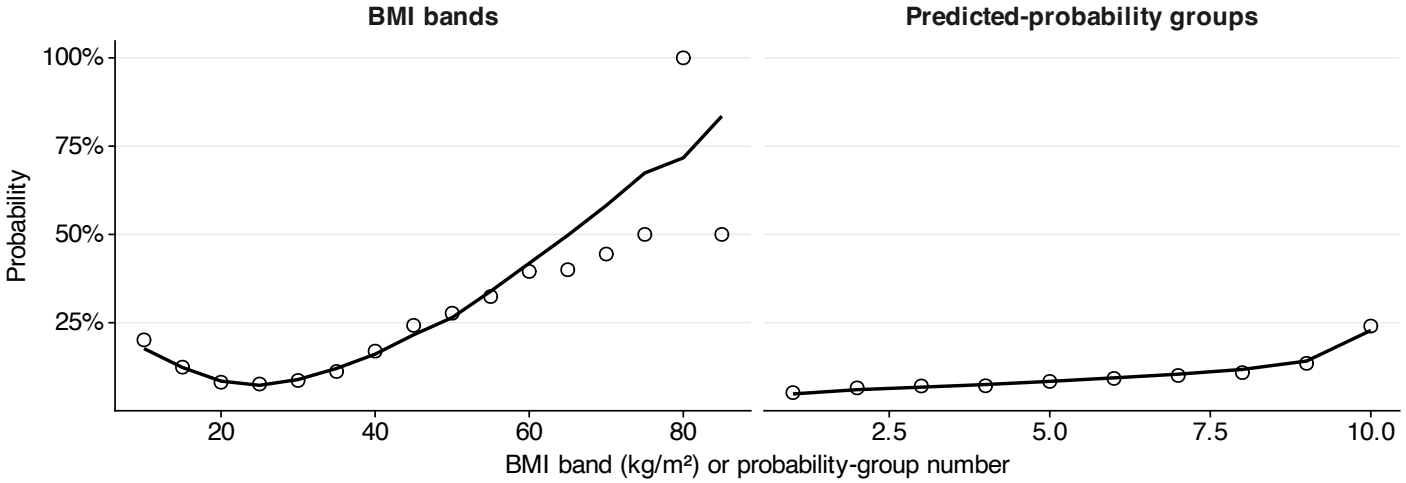
Complete model diagnostics

Training N = 71,318; events = 7,274; in-sample diagnostics

Model: matched/abg/icd

Open points: observed means; line: fitted means



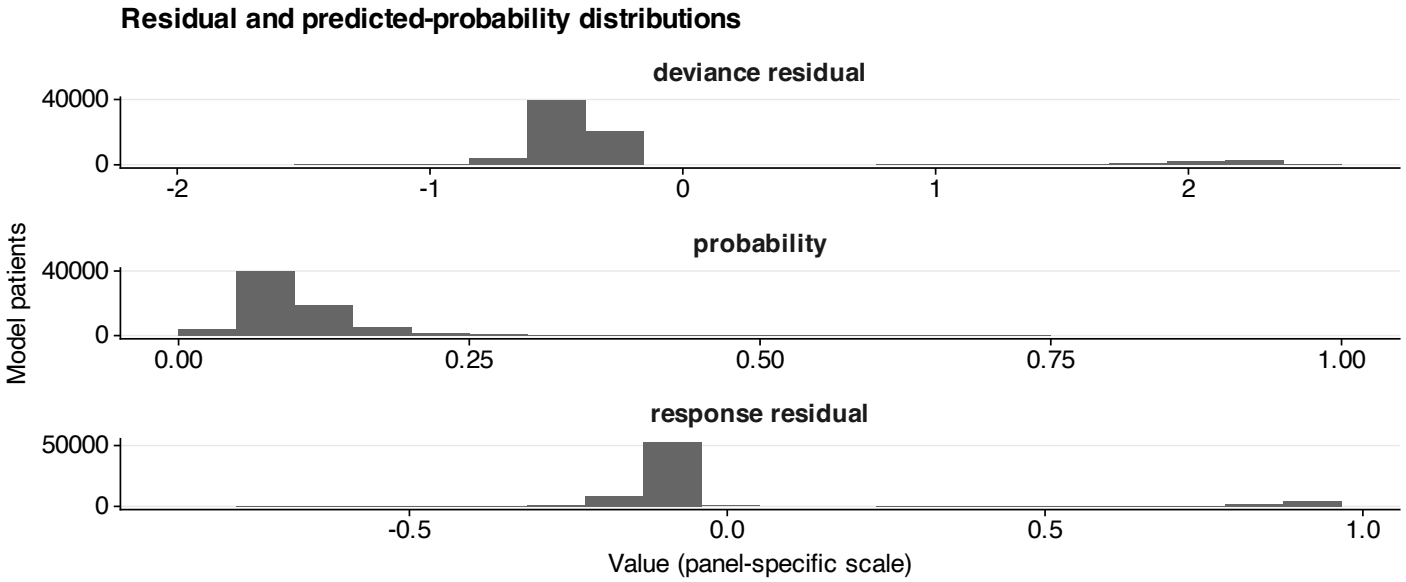


Figure 626: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model matched/abg/icd apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 71,318; events = 32,990; in-sample diagnostics

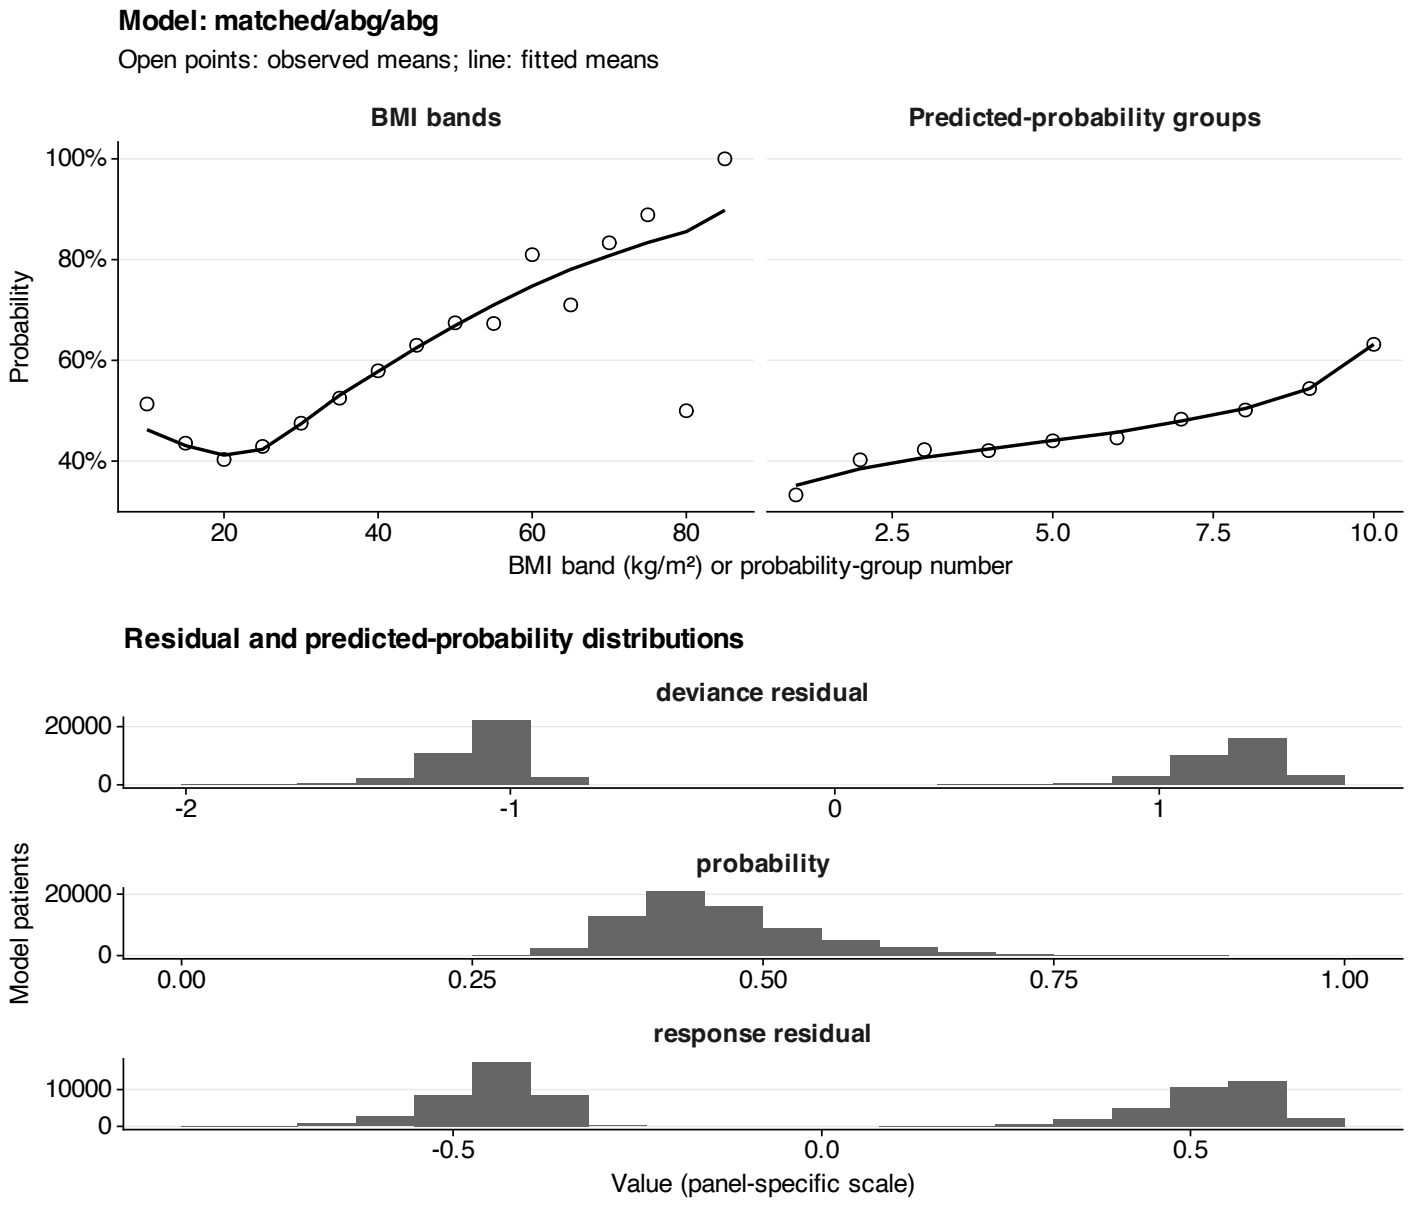

Figure 627: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model matched/abg/abg apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 126,074; events = 9,041; in-sample diagnostics

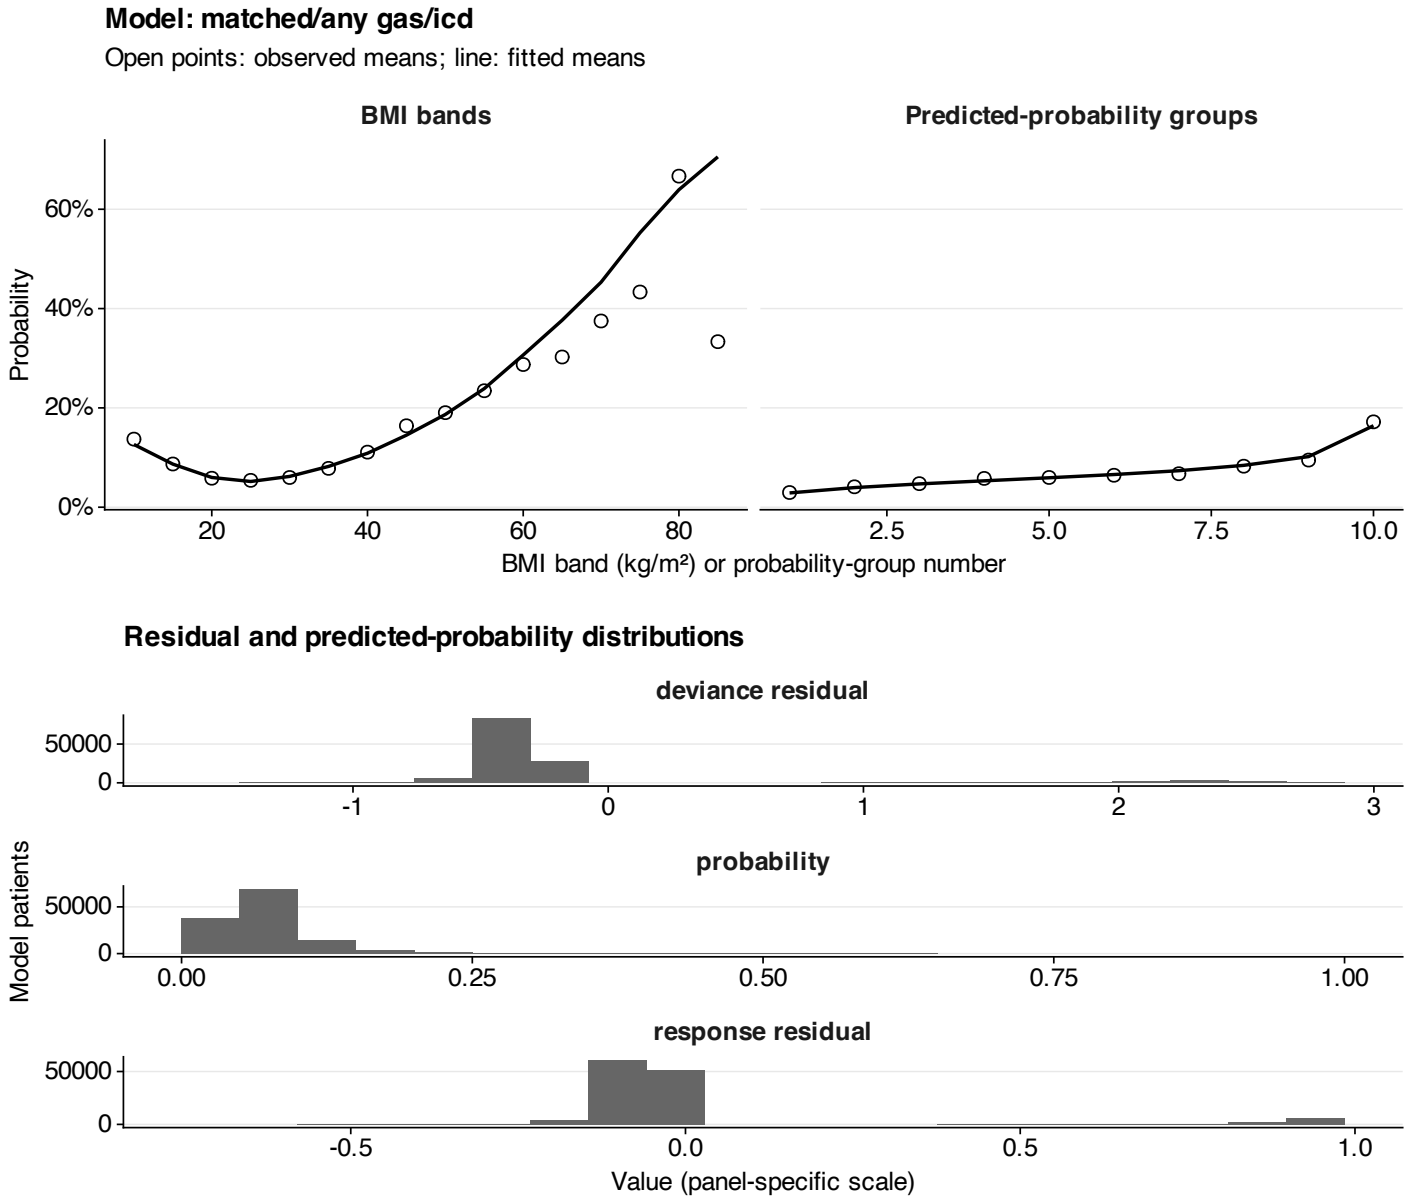

Figure 628: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model matched/any_gas/icd apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 126,074; events = 51,700; in-sample diagnostics

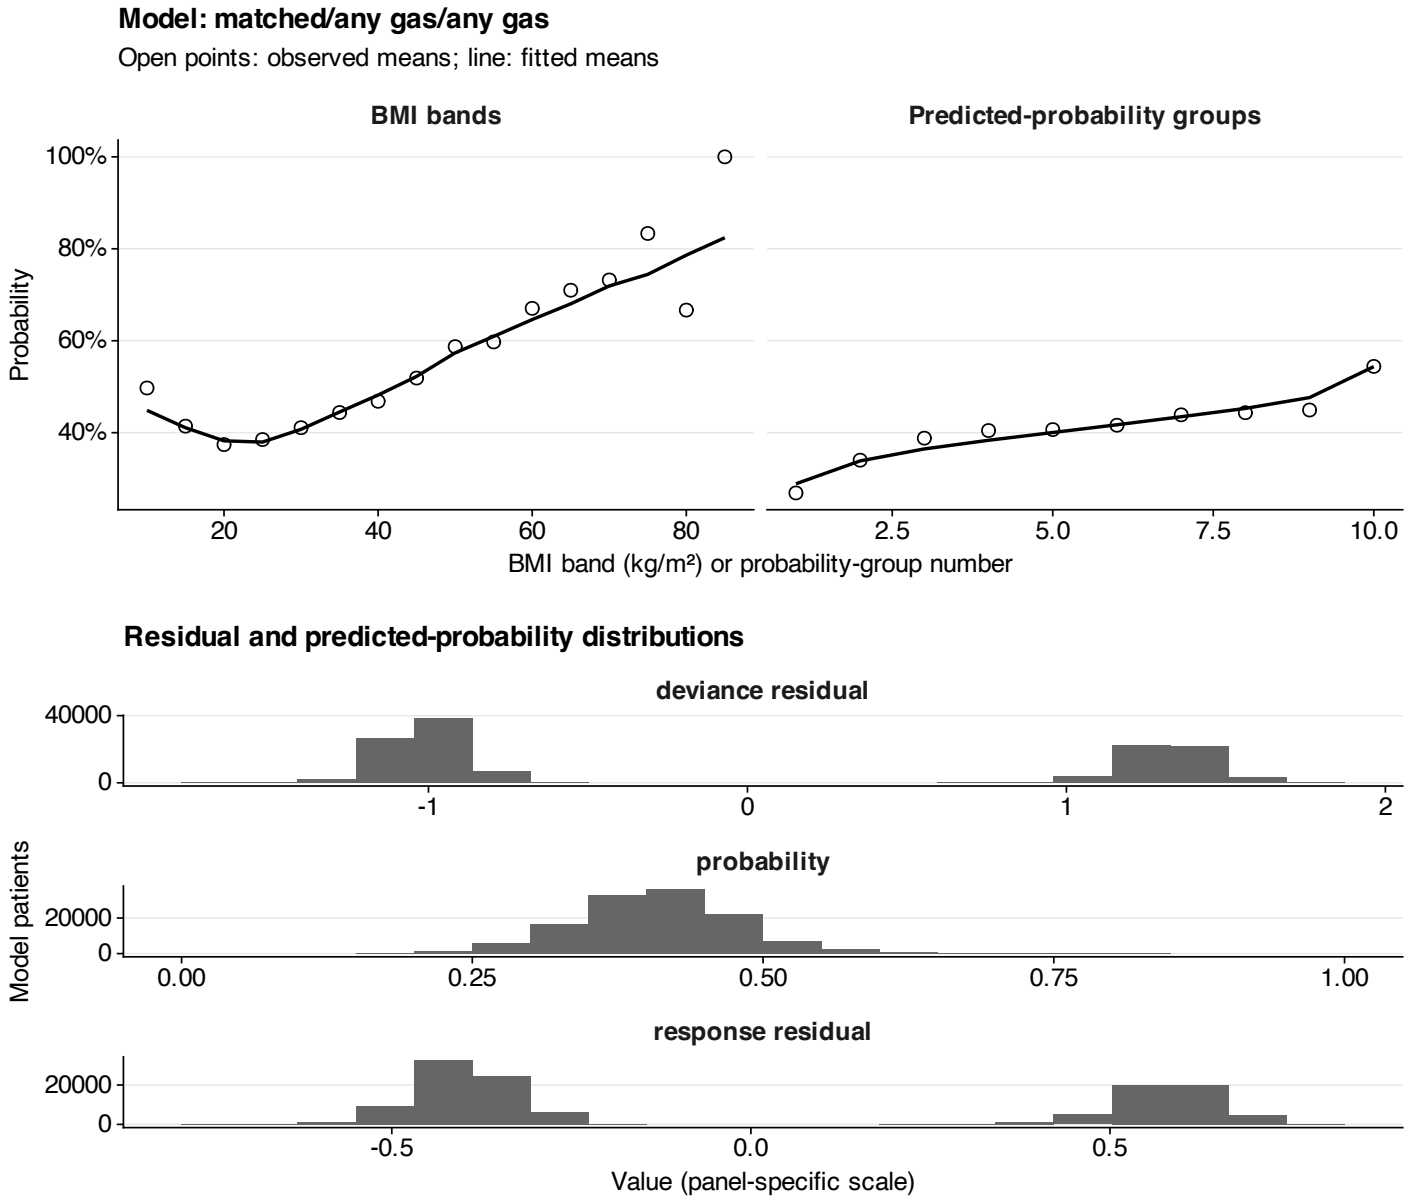

Figure 629: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model matched/any_gas/any_gas apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 29,021; events = 15,209; in-sample diagnostics

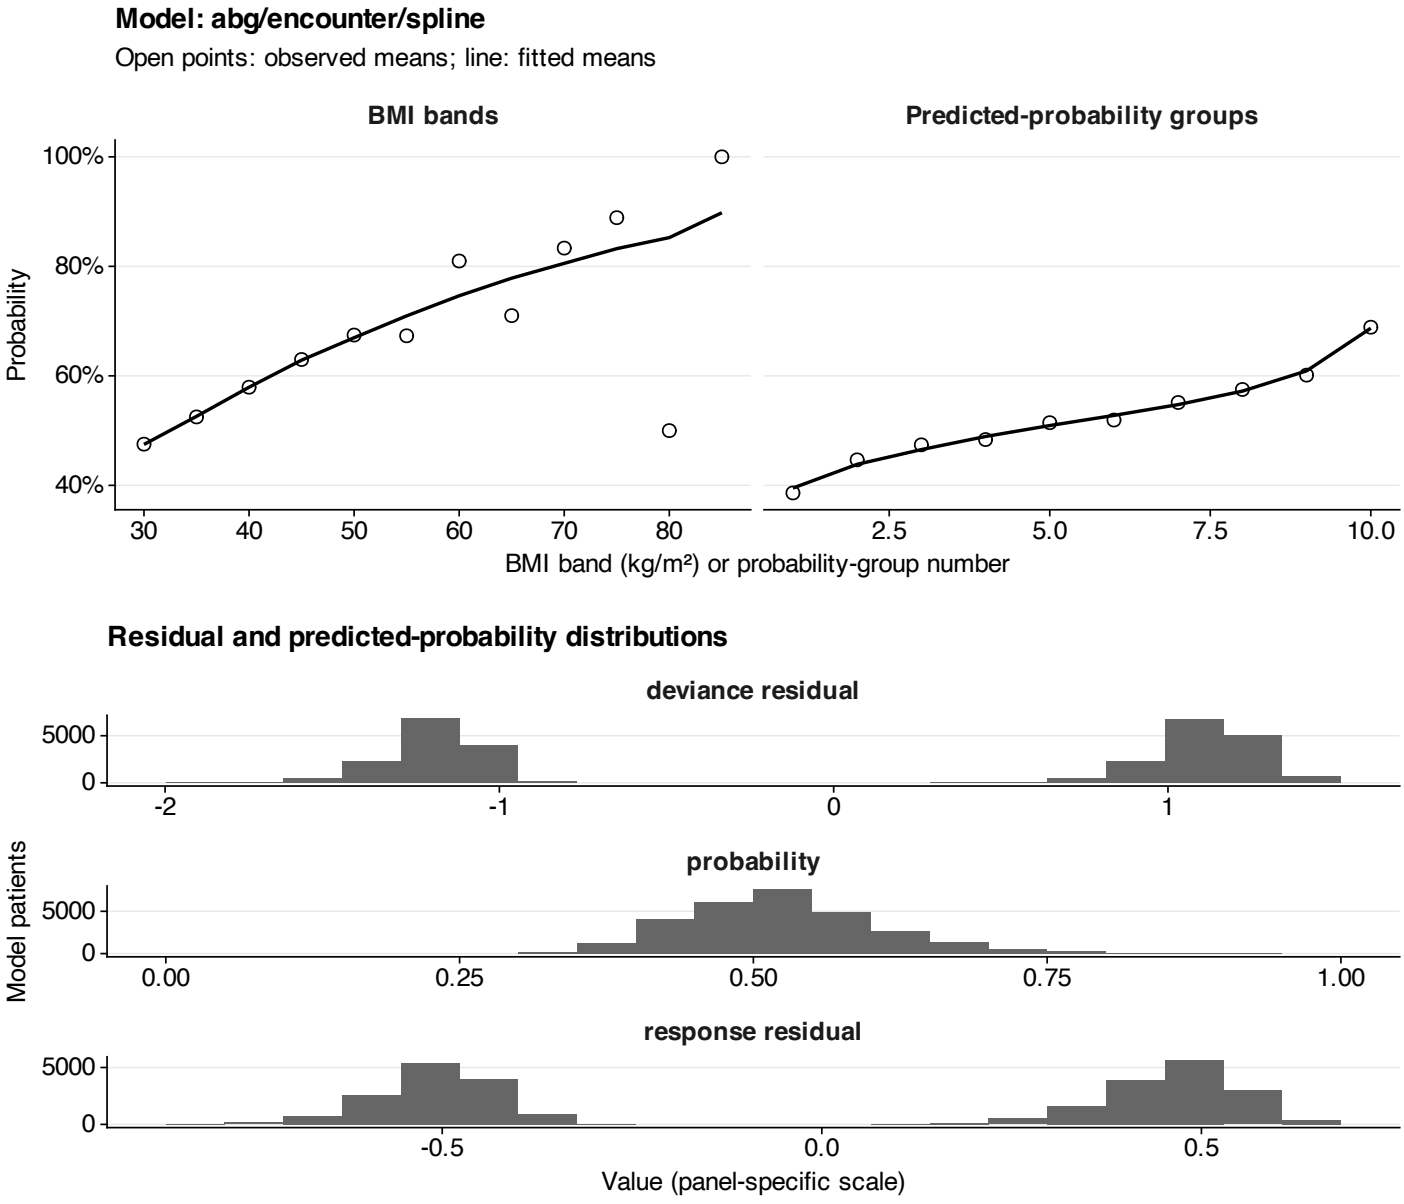

Figure 630: Analysis population: BMI ≥30: secondary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model abg/encounter/spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 52,047; events = 23,179; in-sample diagnostics

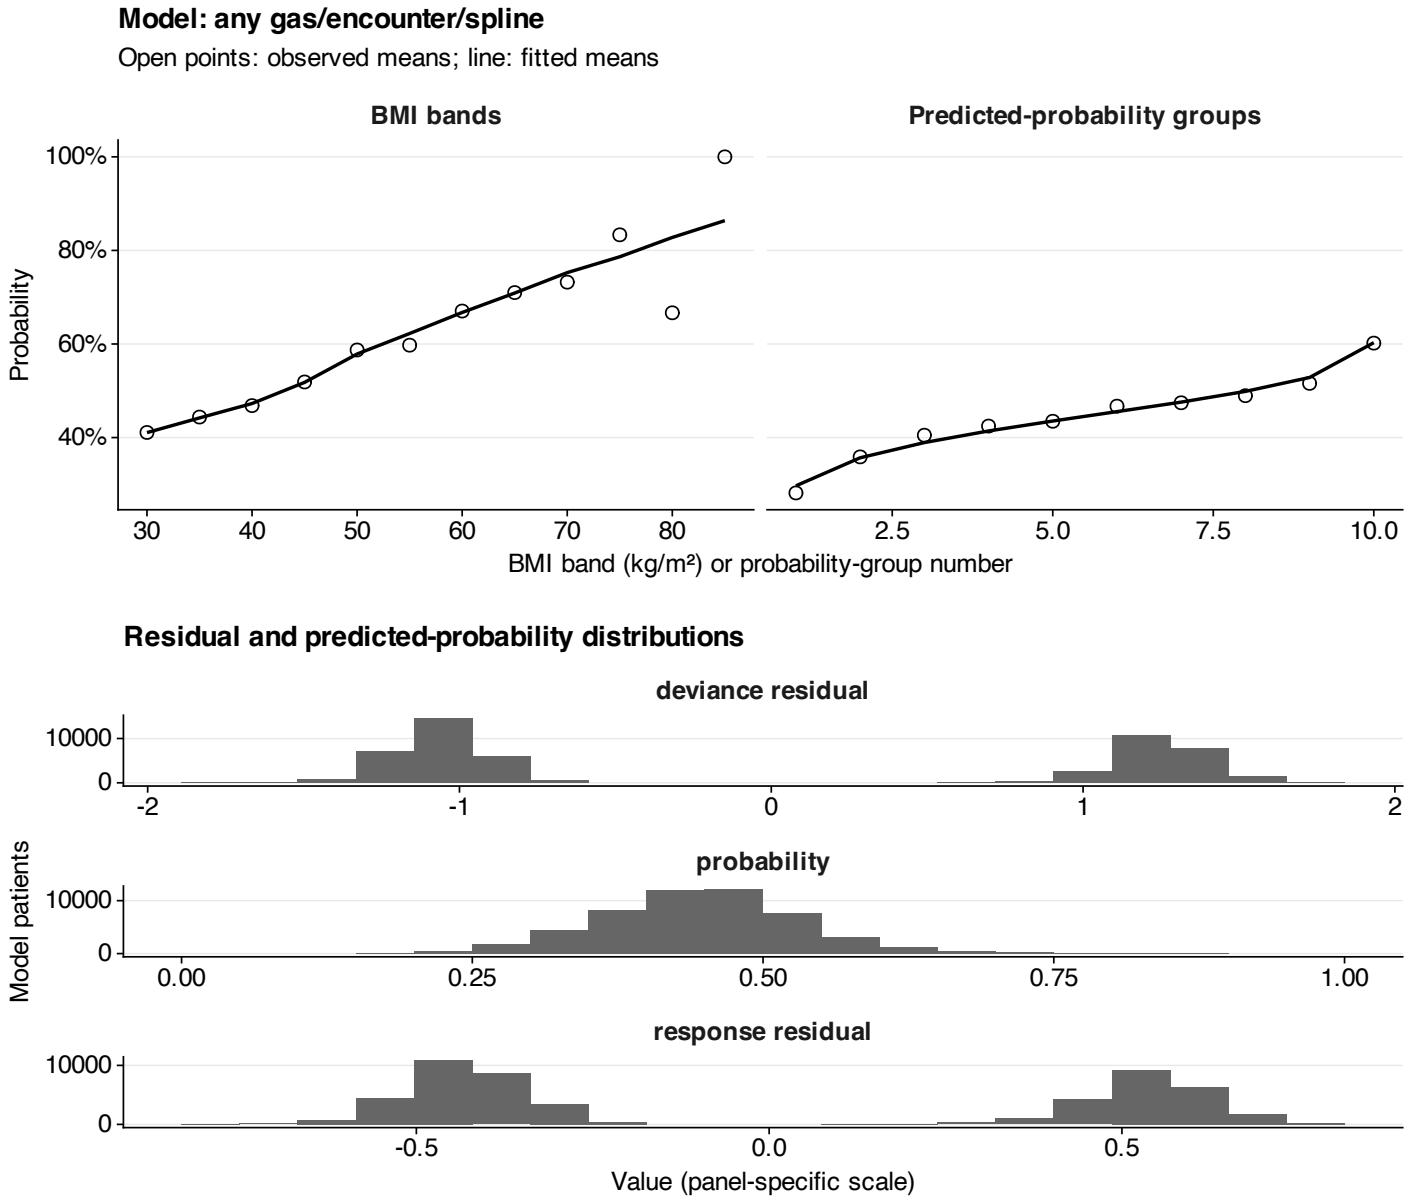

Figure 631: Analysis population: BMI ≥30: secondary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model any_gas/encounter/spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 175,271; events = 8,438; in-sample diagnostics

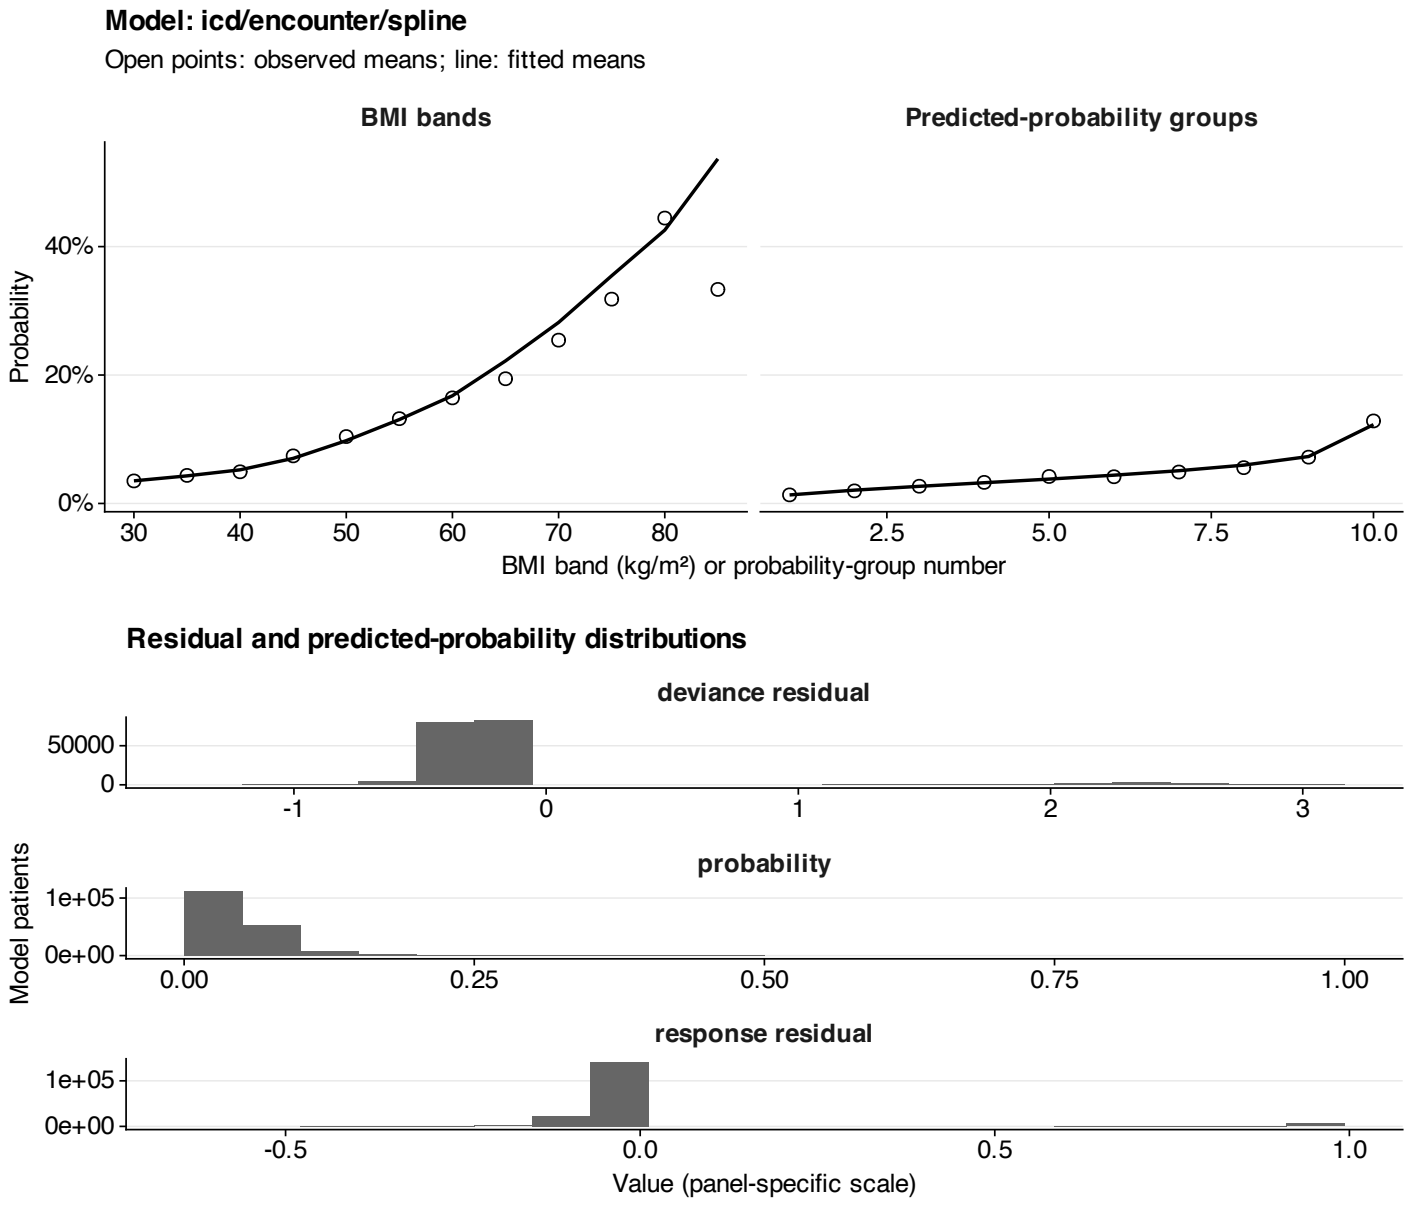

Figure 632: Analysis population: BMI ≥30: secondary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model icd/encounter/spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 56,344; events = 26,198; in-sample diagnostics

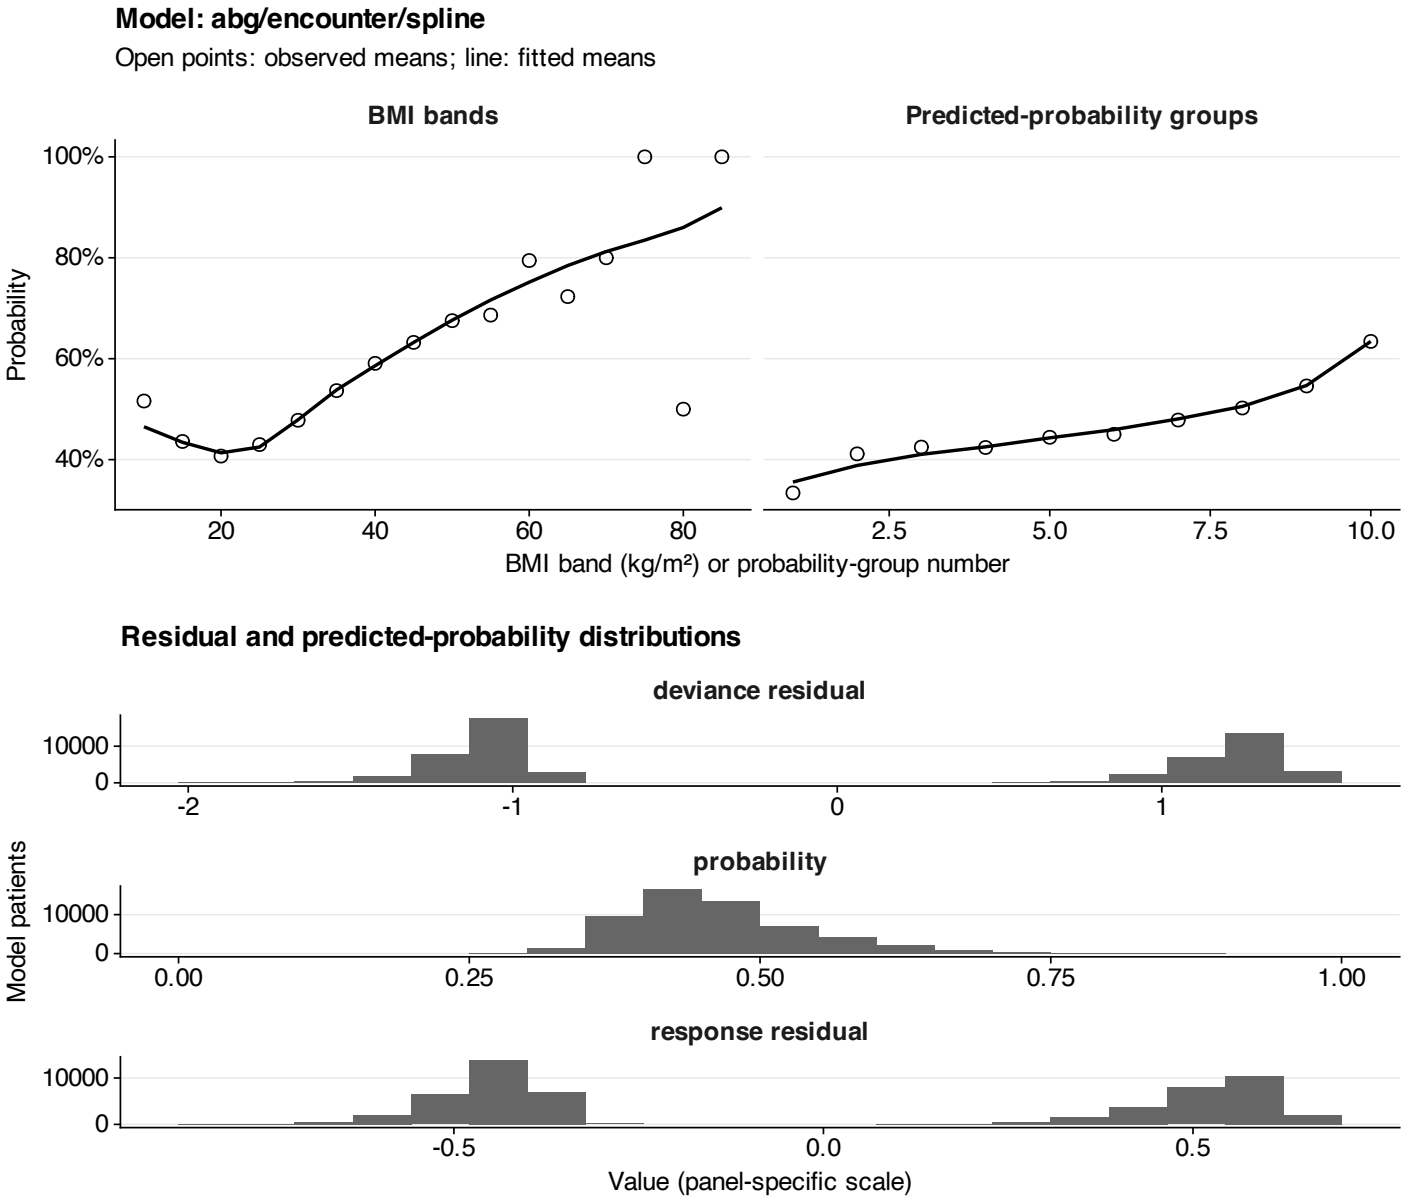

Figure 633: Analysis population: Current BMI: sensitivity. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model abg/encounter/spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

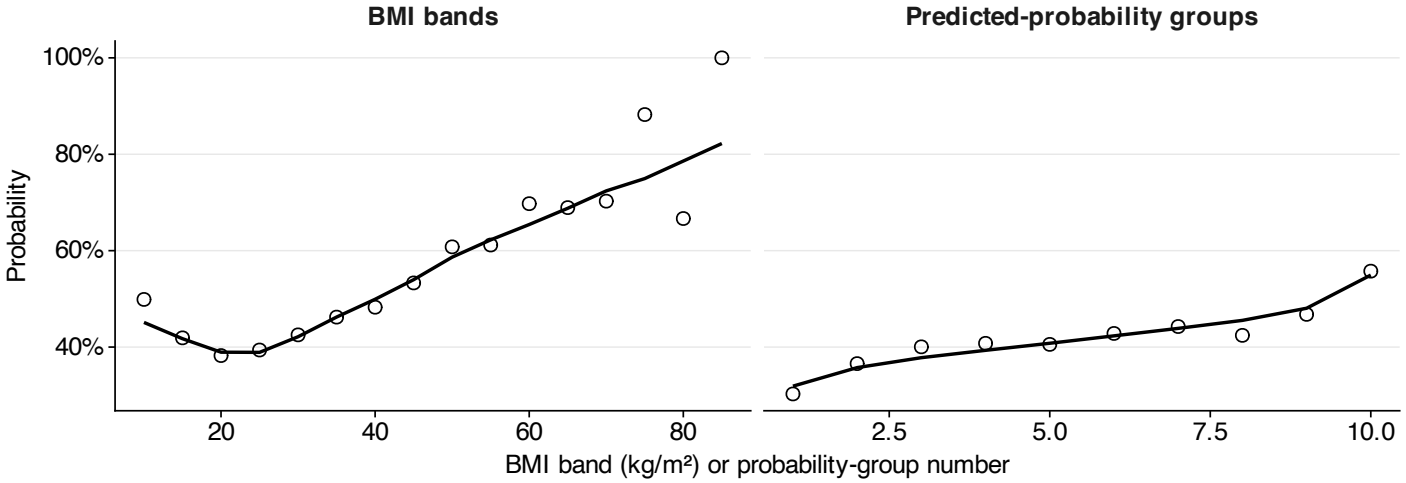
Complete model diagnostics

Training N = 93,695; events = 39,377; in-sample diagnostics

Model: any gas/encounter/spline

Open points: observed means; line: fitted means



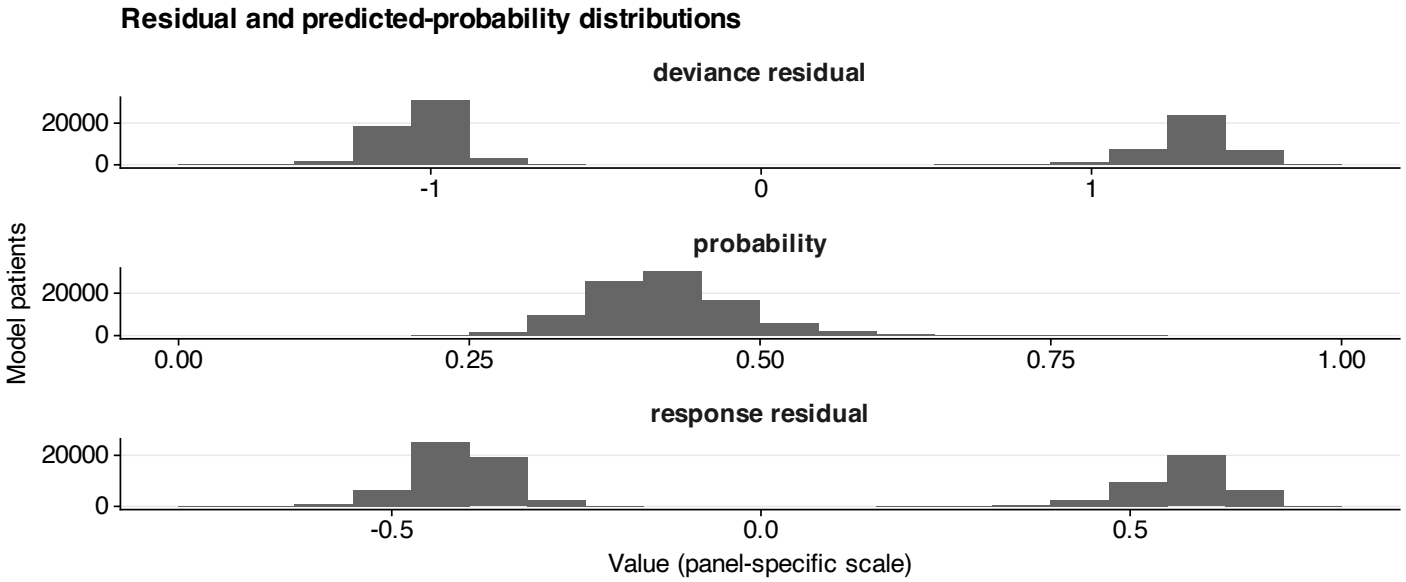


Figure 634: Analysis population: Current BMI: sensitivity. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model any_gas/encounter/spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

4.27 Model: primary_current::icd/encounter/spline

Complete model diagnostics

Training N = 278,348; events = 12,087; in-sample diagnostics

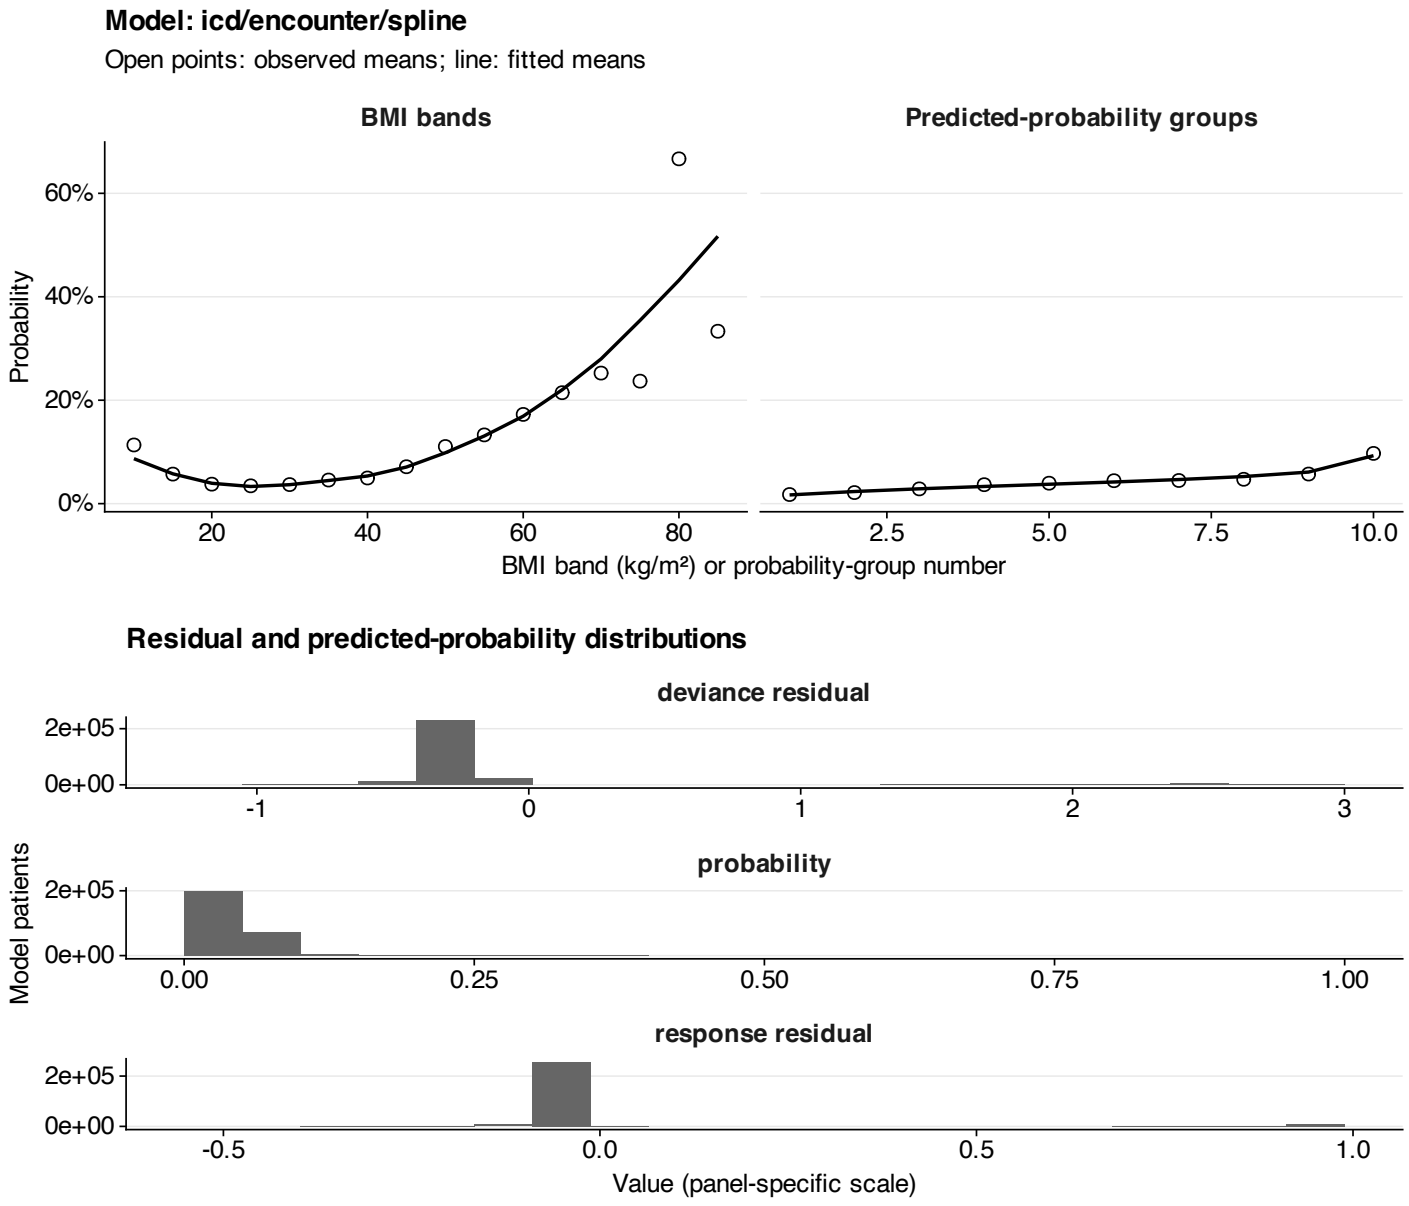

Figure 635: Analysis population: Current BMI: sensitivity. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model icd/encounter/spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 3,868; events = 2,454; in-sample diagnostics

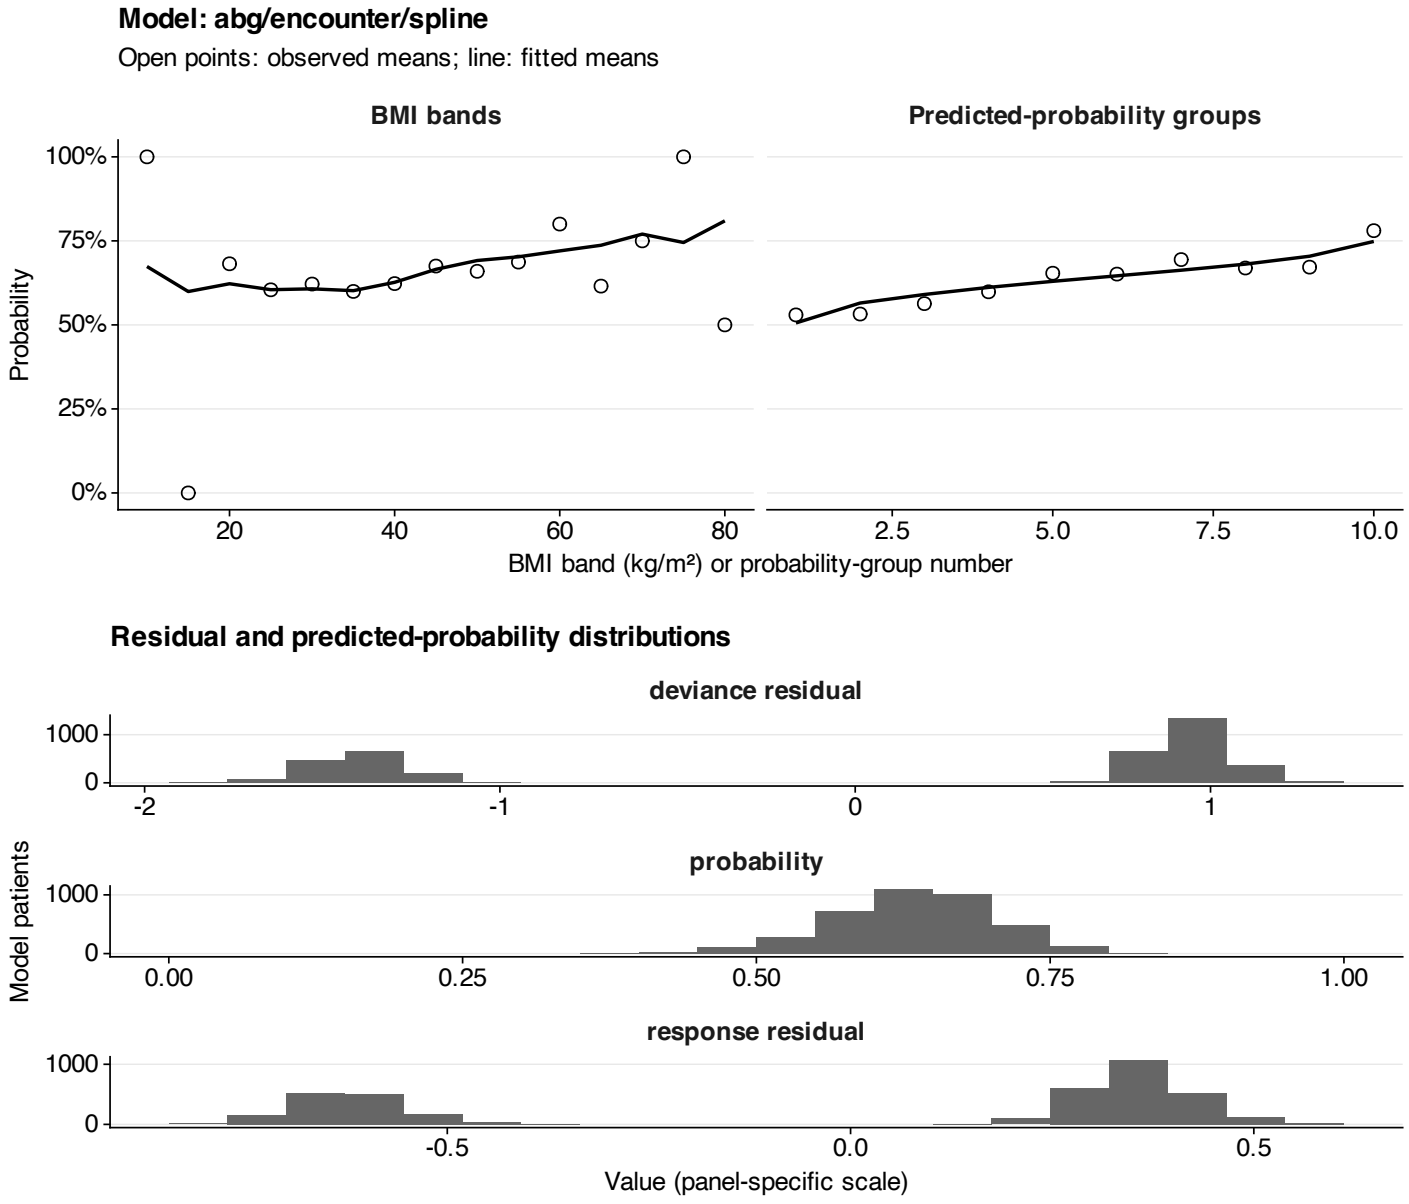

Figure 636: Analysis population: All OBESITY routes: overlapping sensitivity. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model abg/encounter/spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 6,410; events = 3,365; in-sample diagnostics

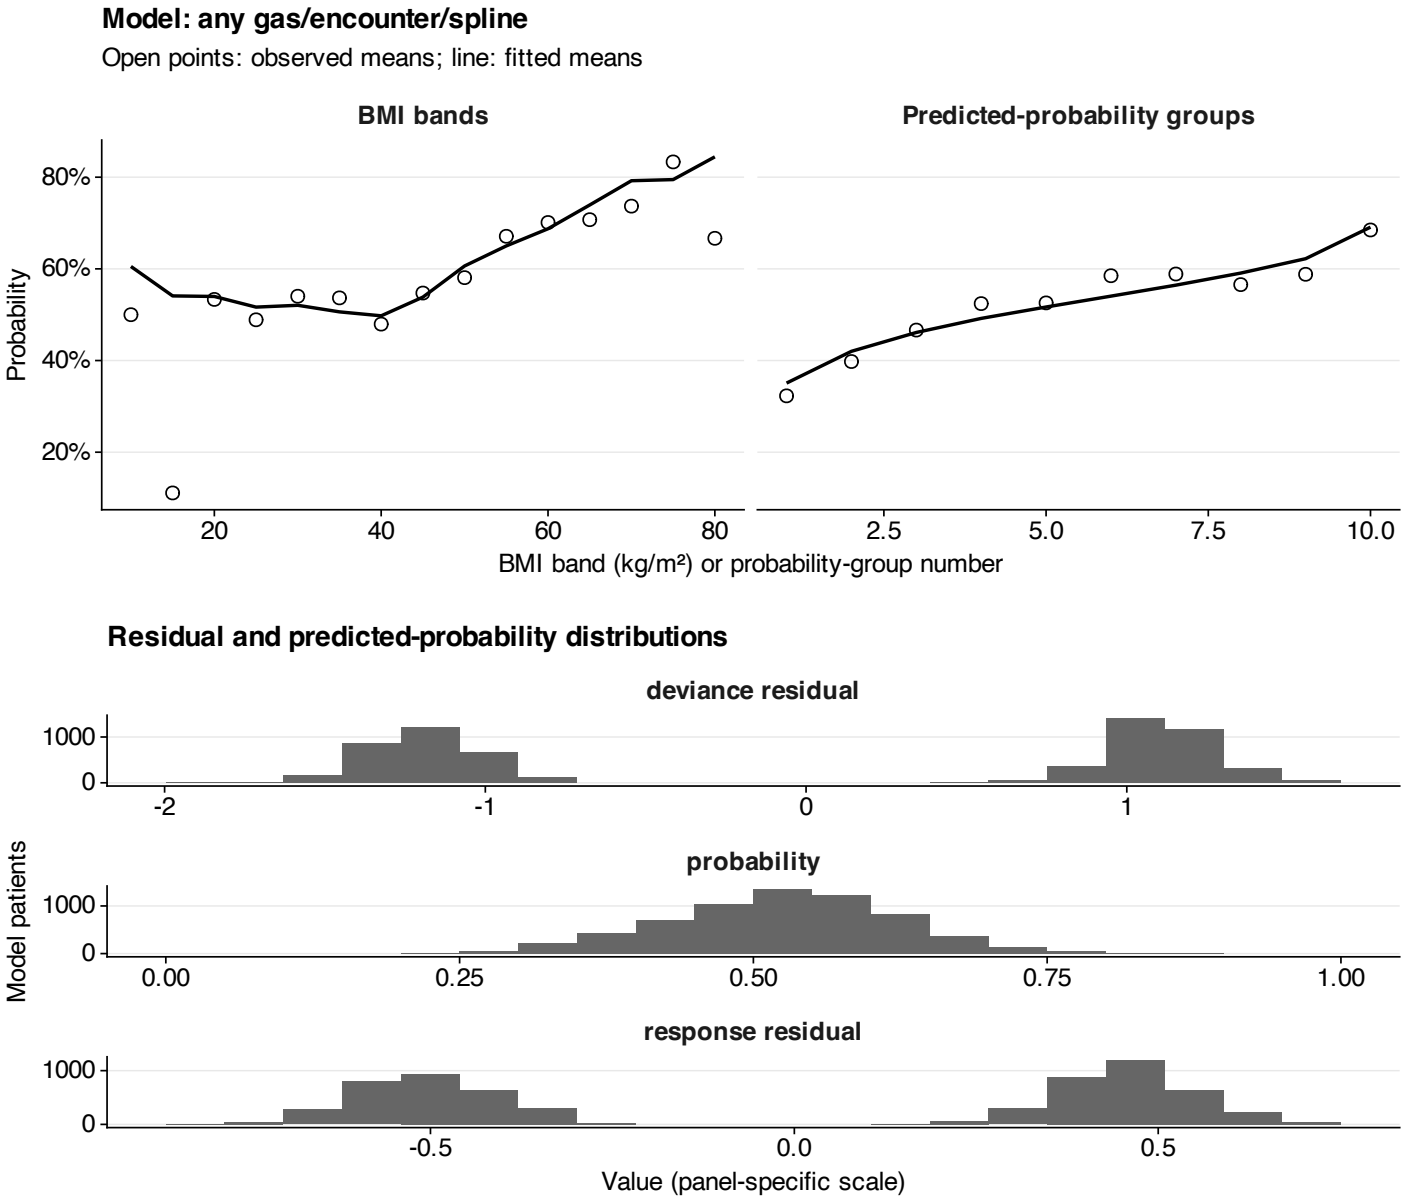

Figure 637: Analysis population: All OBESITY routes: overlapping sensitivity. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model any_gas/encounter/spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Complete model diagnostics

Training N = 76,913; events = 2,277; in-sample diagnostics

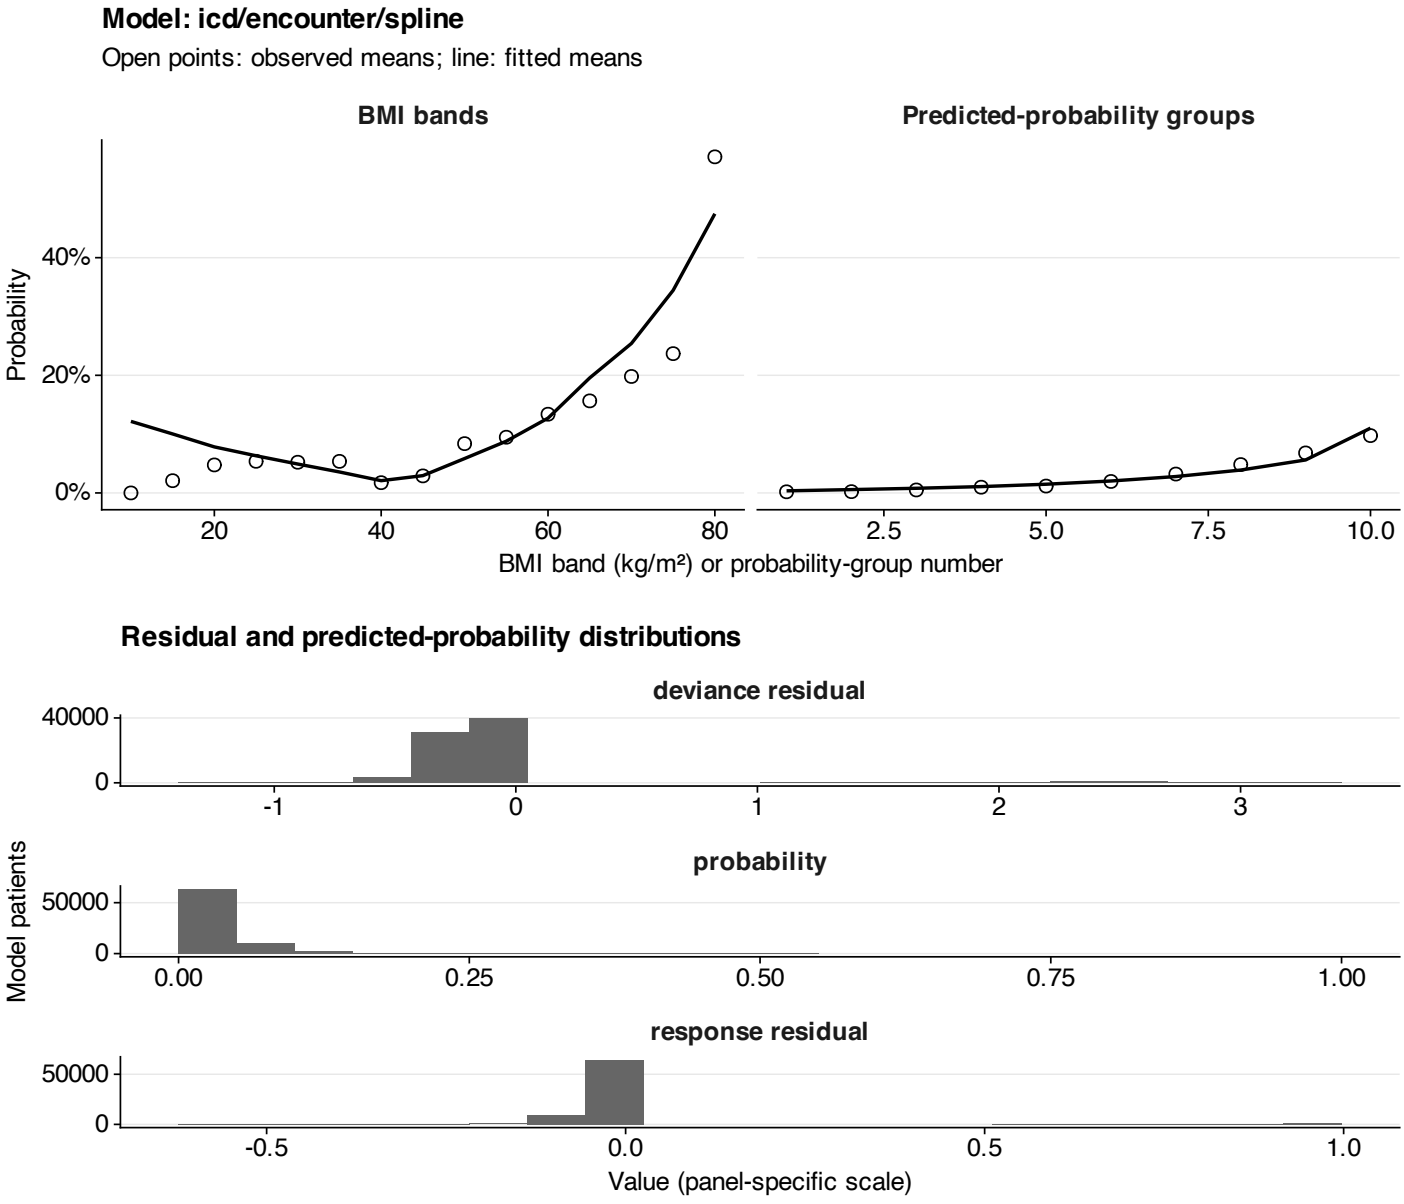

Figure 638: Analysis population: All OBESITY routes: overlapping sensitivity. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model icd/encounter/spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

Table 999: model_influence_summary

Field	Value
model id	primary::same day abg/encounter/multinomial spline
metric	case deletion influence
n	unavailable
minimum	unavailable
median	unavailable
q95	unavailable
q99	unavailable
maximum	unavailable
threshold	unavailable
n flagged	unavailable
status	unavailable: no validated multinomial case-deletion implementation; no patients removed
analysis population id	primary
population id	primary
outcome id	three category
ascertainment window	encounter
model form	multinomial spline

model id: primary::same_day_abg/encounter/multinomial_spline; analysis population id: primary; population id: primary; outcome id: three_category; ascertainment window: encounter; model form: multinomial_spline.

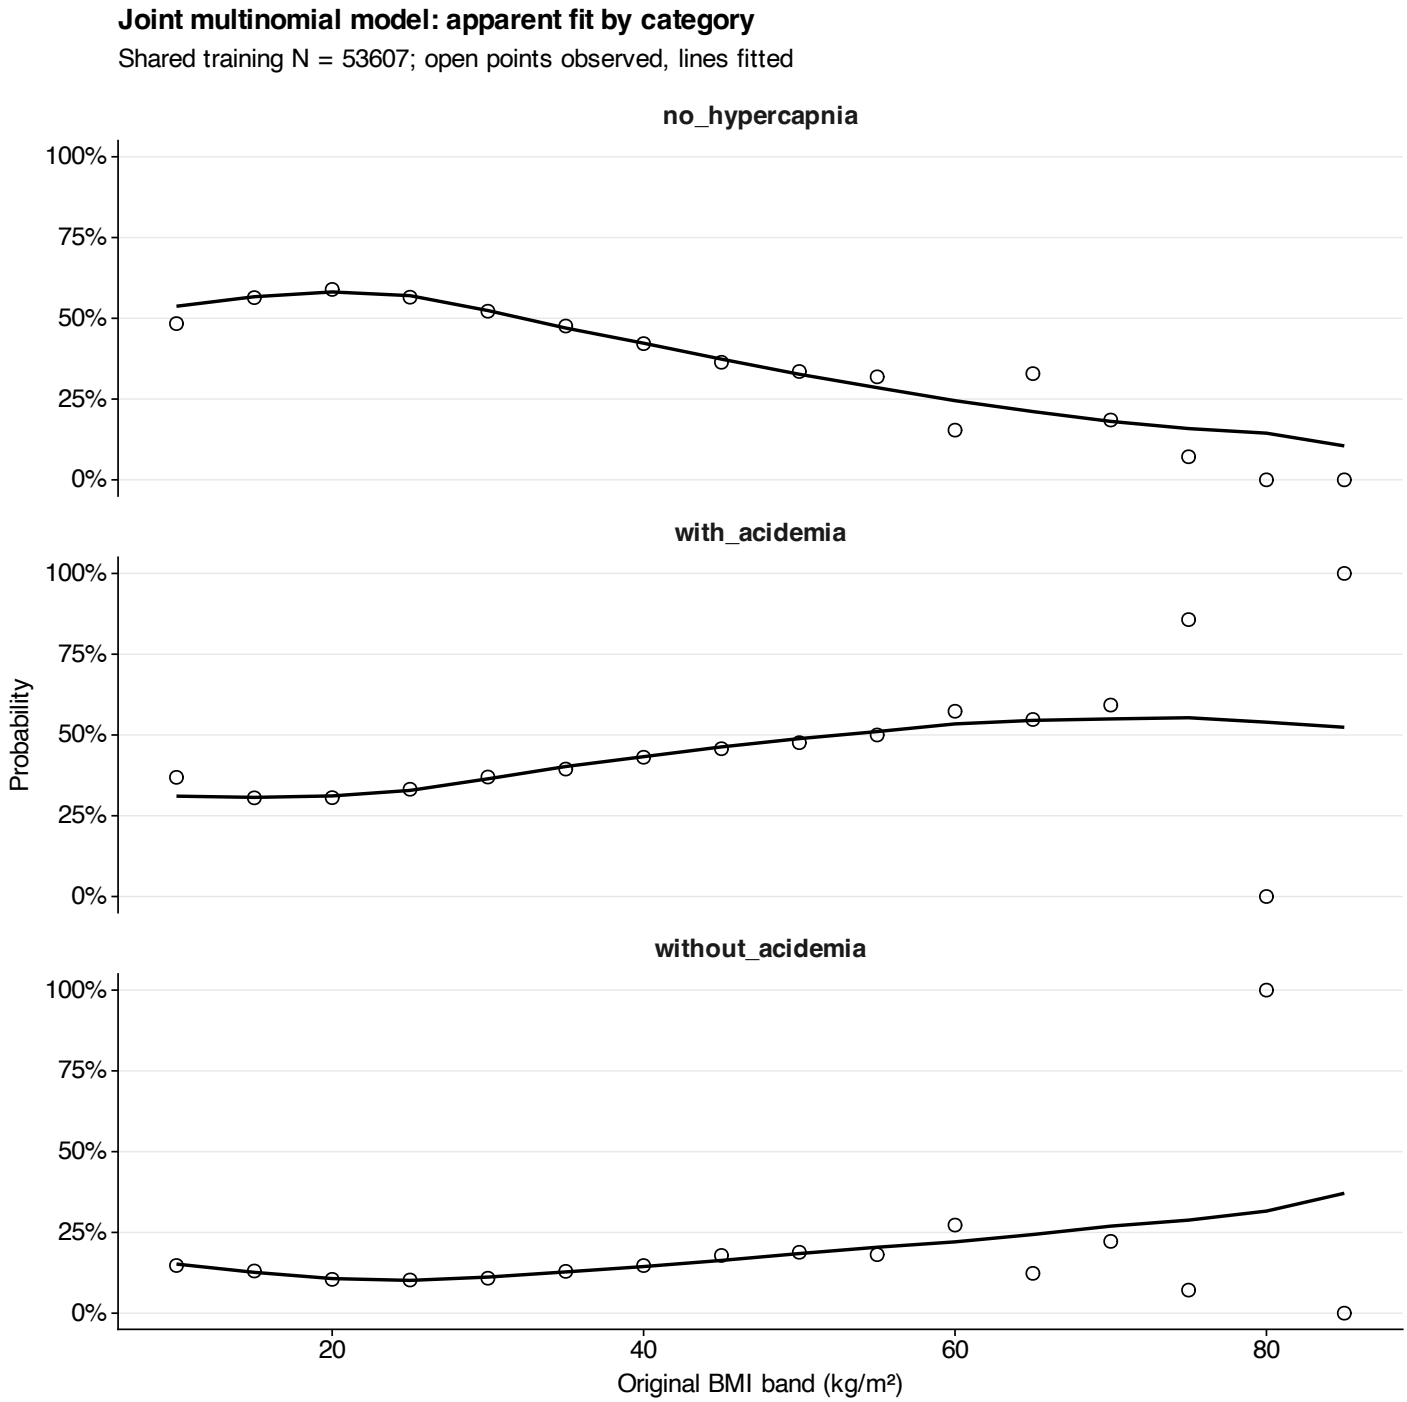

Figure 639: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model same_day_abg/encounter/multinomial_spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

4.32 Model: primary::icd_acuity/encounter/multinomial_spline

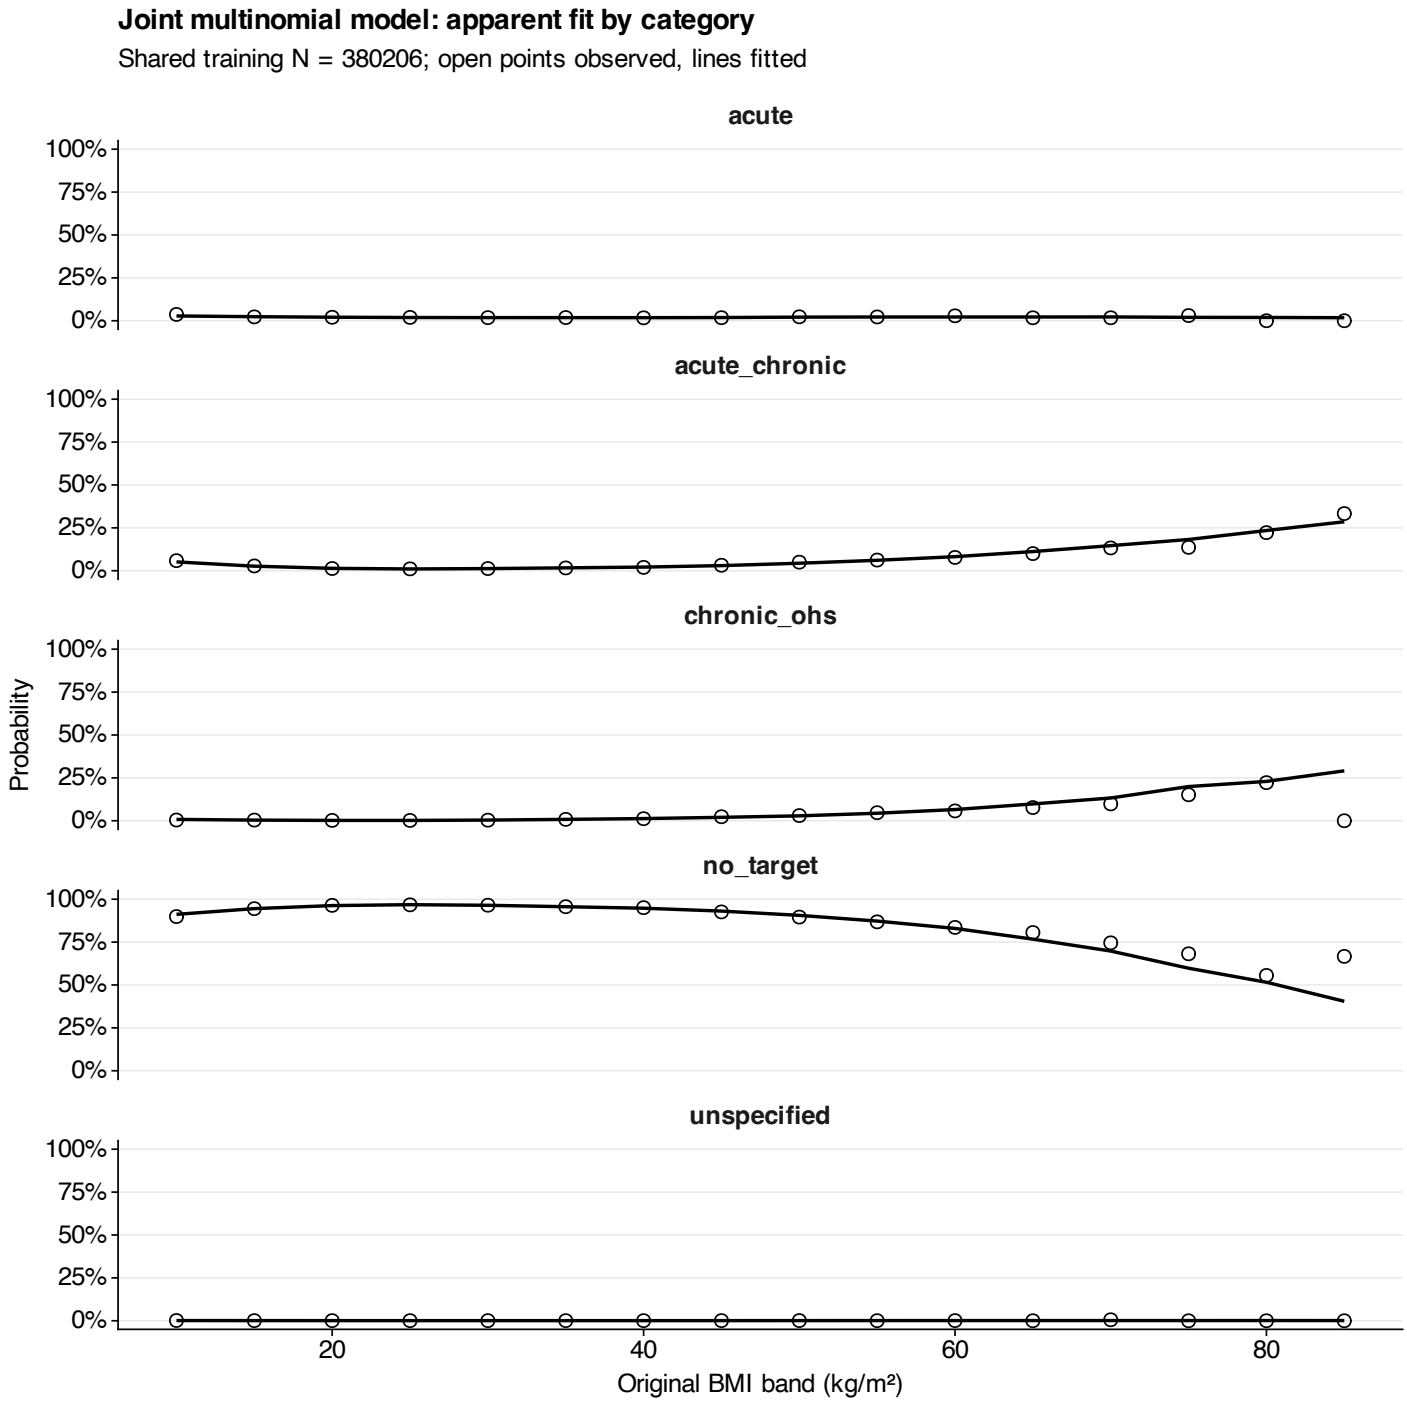

Figure 640: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model icd_acuity/encounter/multinomial_spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

4.33 Model: primary::icd_acuity_specified/encounter/multinomial_spline

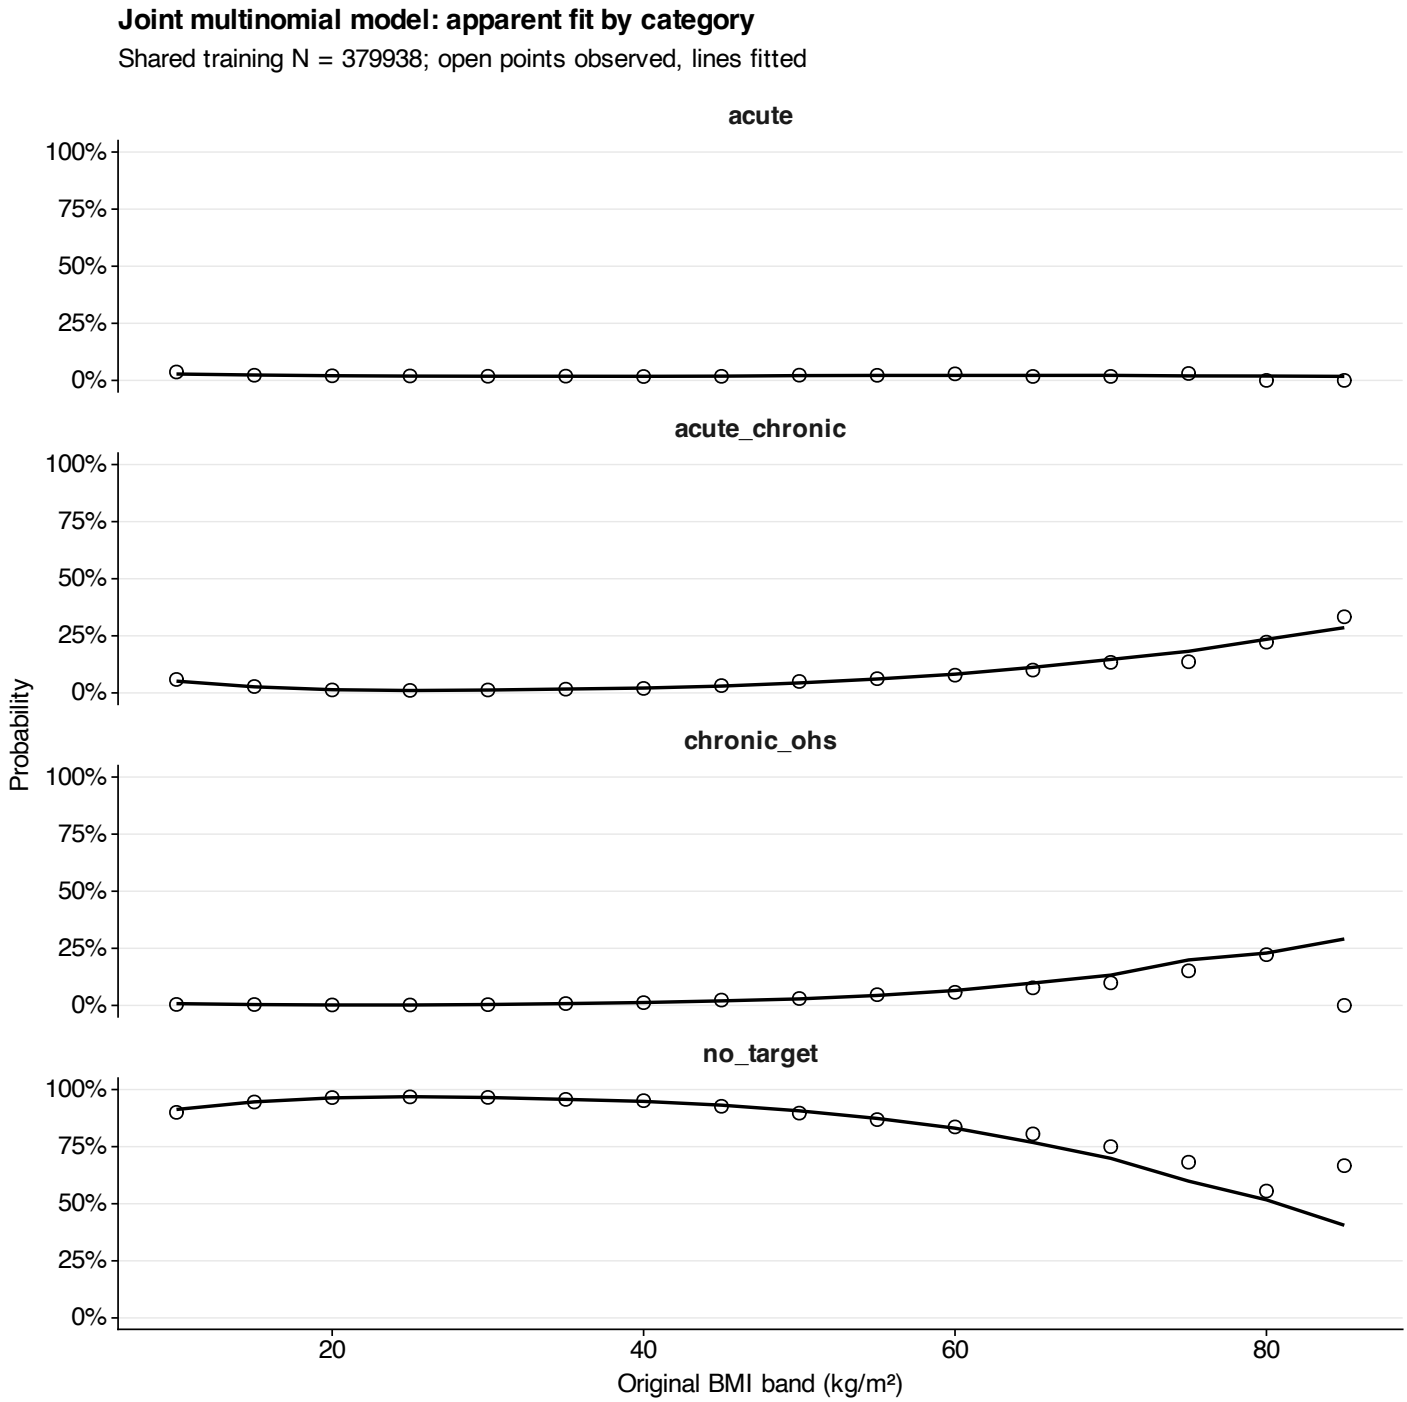

Figure 641: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model icd_acuity_specified/encounter/multinomial_spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

4.34 Model: primary_bmi_ge30::same_day_abg/encounter/multinomial_spline

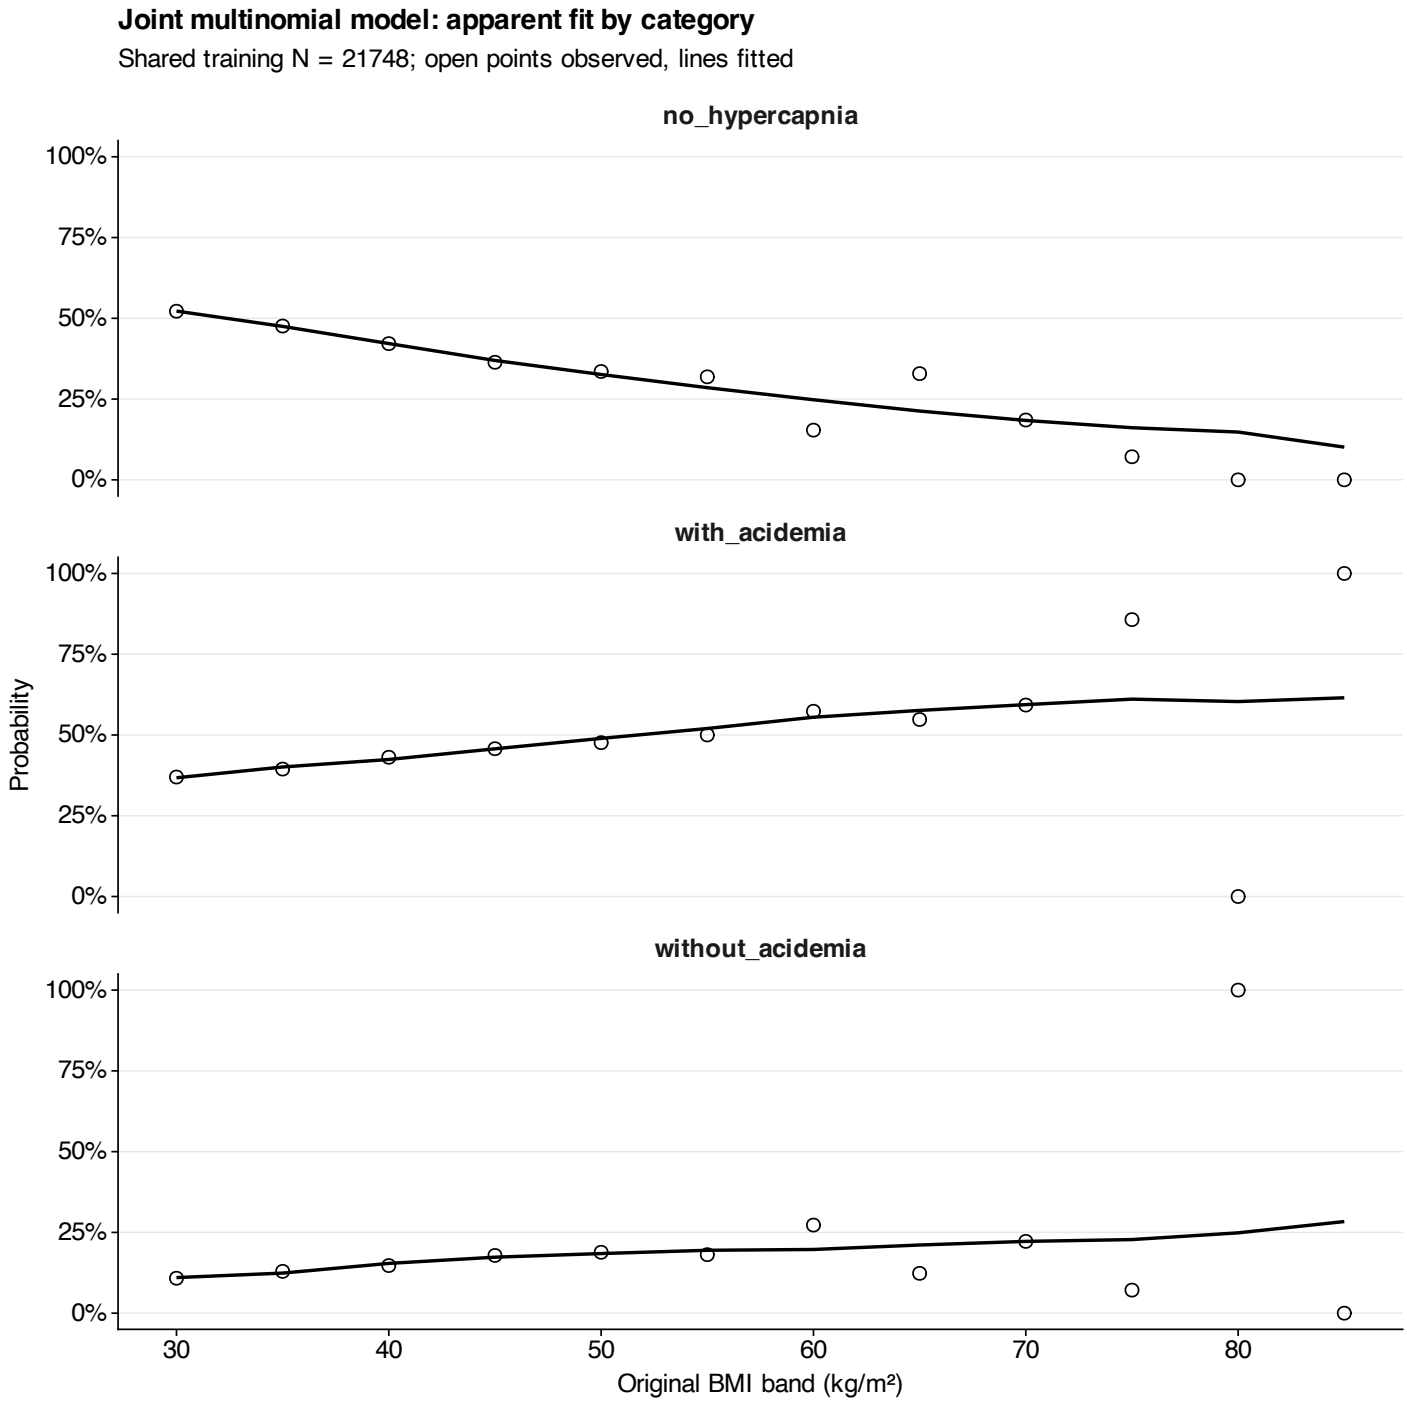

Figure 642: Analysis population: BMI ≥30: secondary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model same_day_abg/encounter/multinomial_spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

4.35 Model: primary_bmi_ge30::icd_acuity/encounter/multinomial_spline

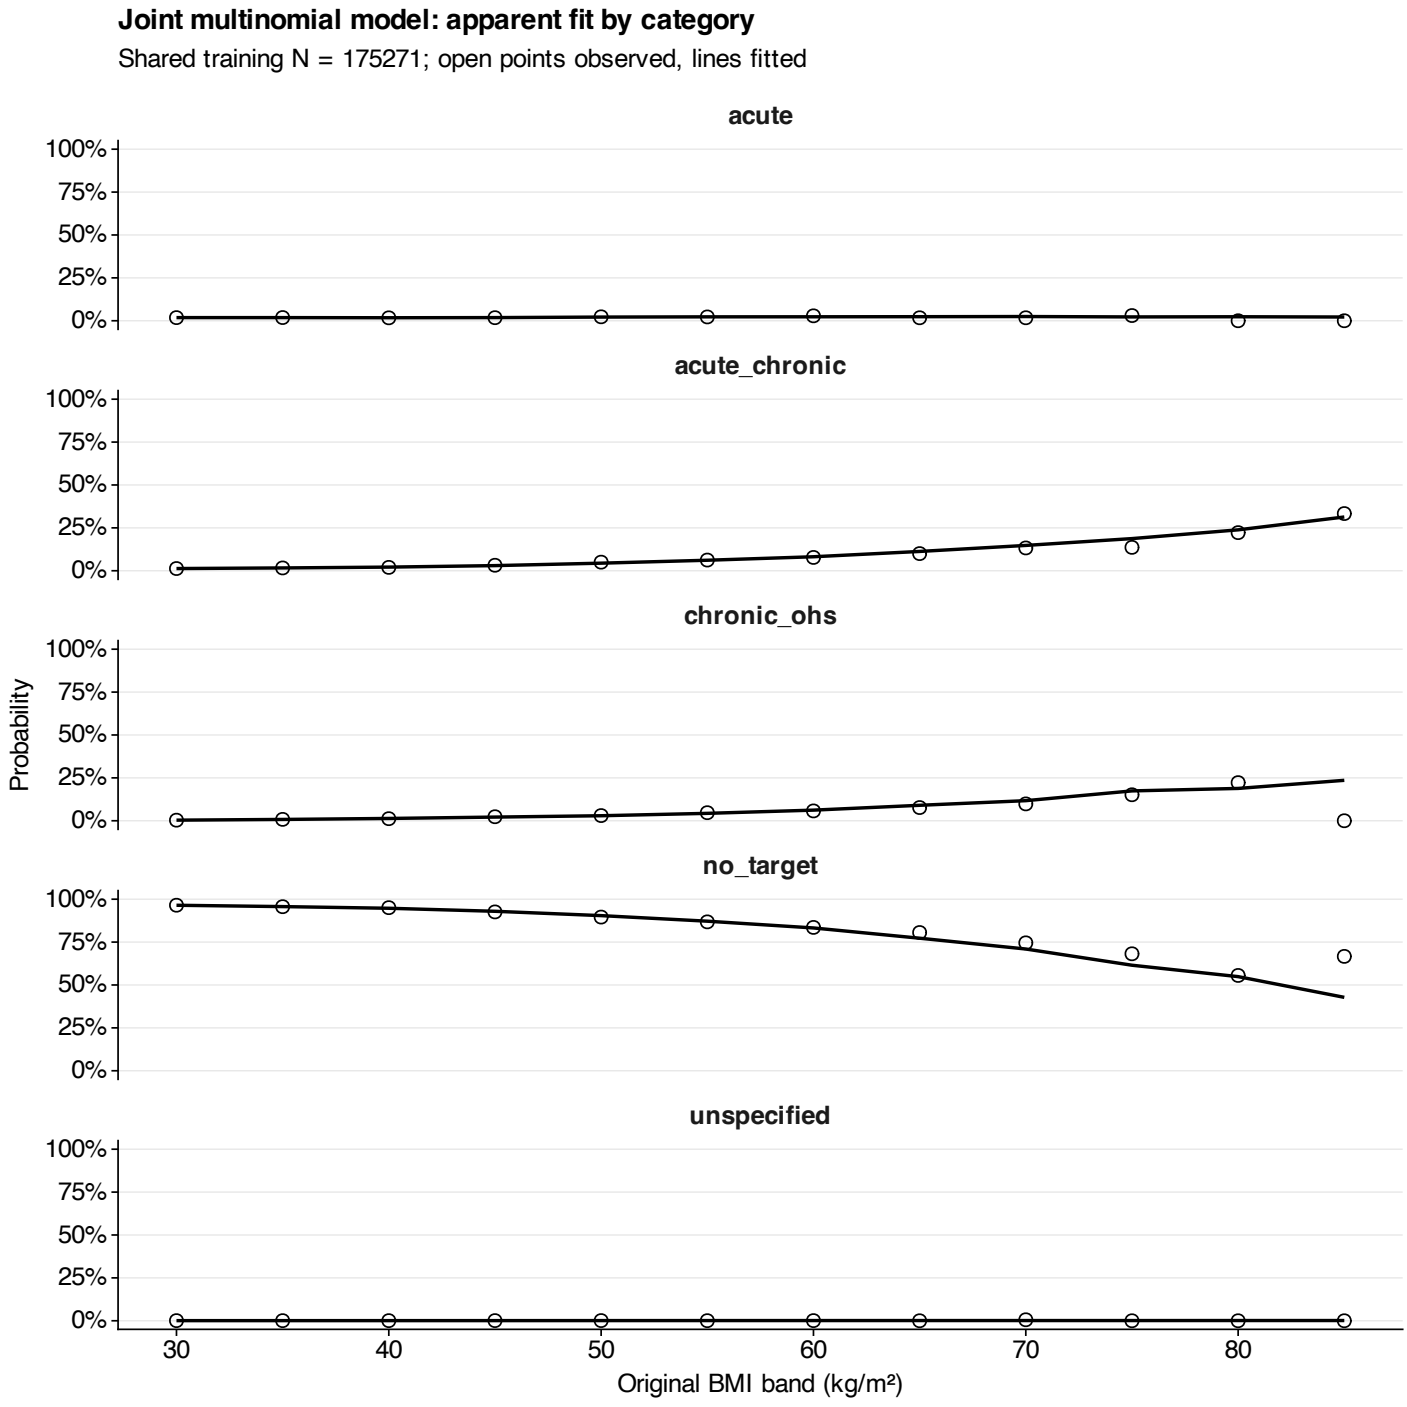

Figure 643: Analysis population: BMI ≥30: secondary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F4. Model icd_acuity/encounter/multinomial_spline apparent fit and full-sample diagnostics. Influence flags do not exclude observations. Failure positions remain visible.

4.36 Model: primary_bmi_ge30::icd_acuity_specified/encounter/multinomial_spline

5 Relationship, support and scenario reconciliation

Curves are policy-independent. Gas curves and scenarios standardize to their outcome-observed training populations; ICD curves use C_icd with known diagnosis capture. Observation models describe evidence availability over C. No physiological outcomes are projected to untested patients. Full-cohort MAR/MNAR projections remain only in the frozen historical run. No cross-model difference test is inferred from independent interval overlap.

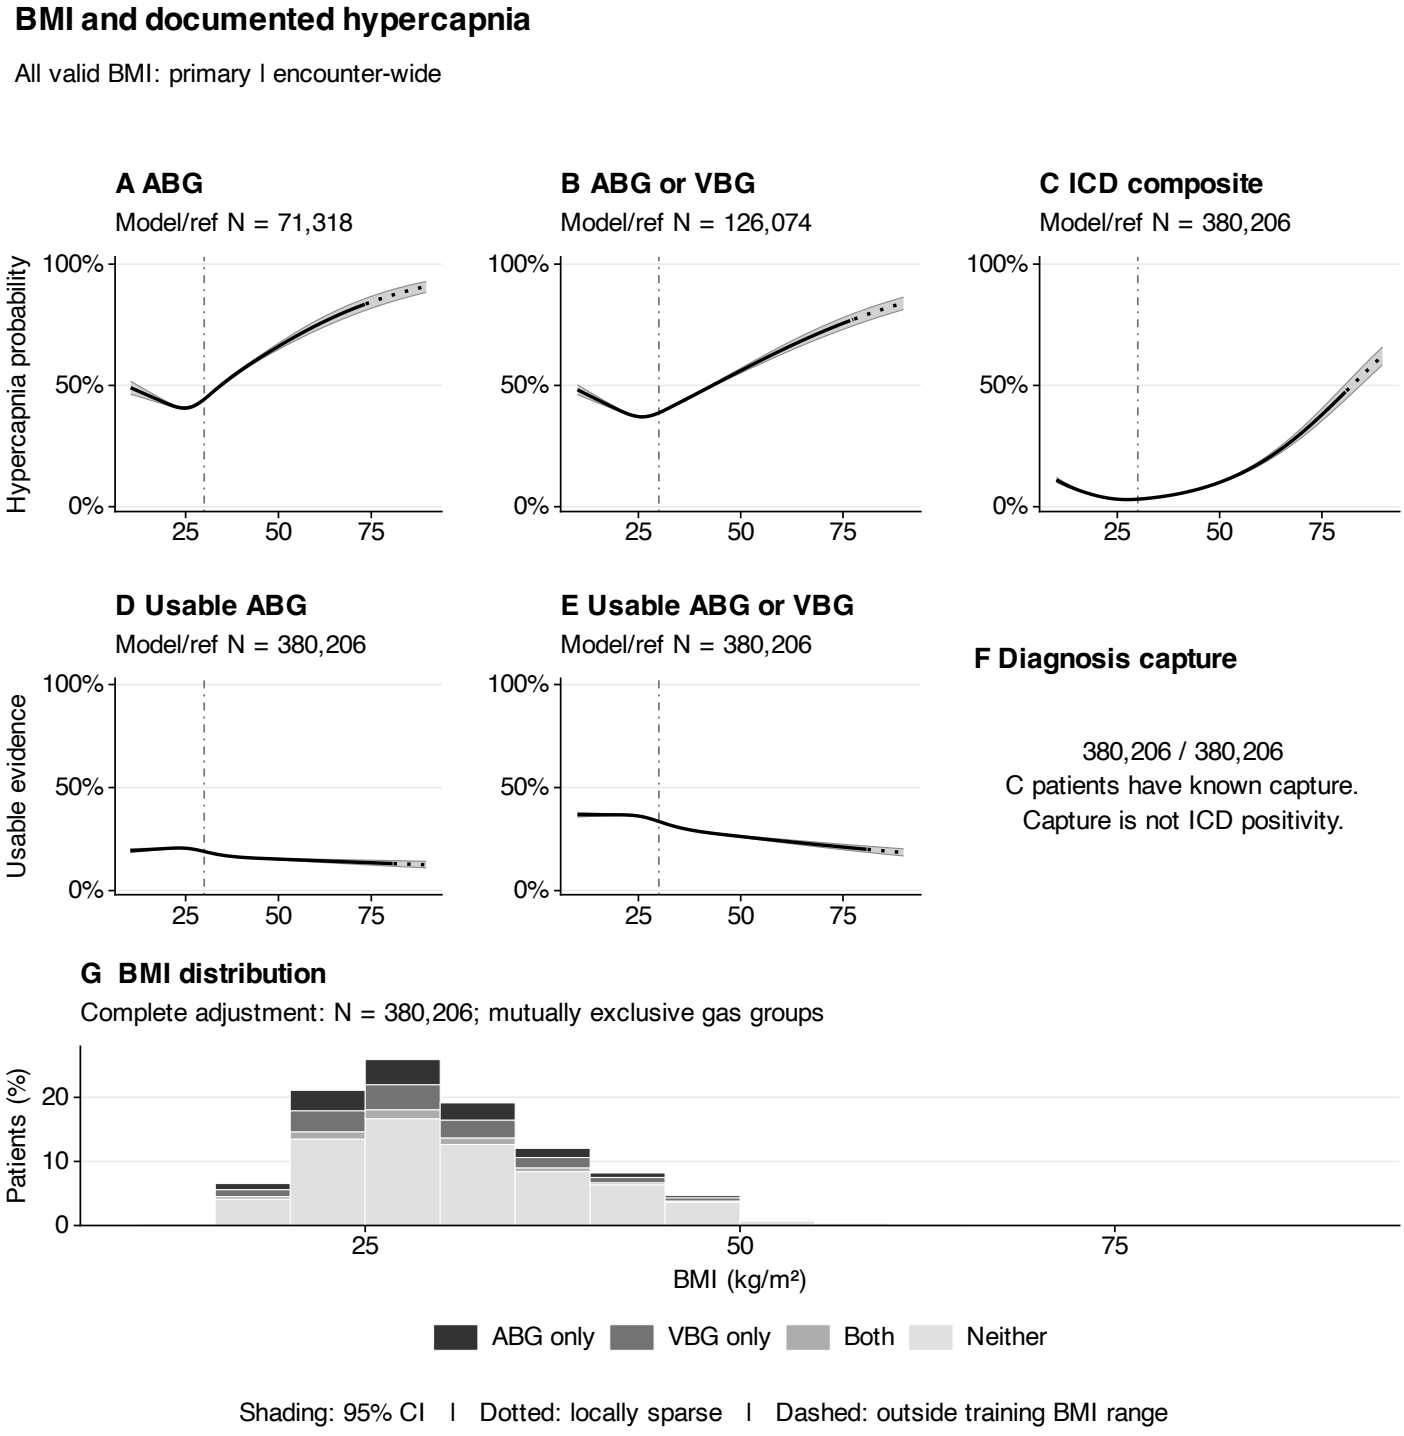

Figure 645: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F1. BMI–hypercapnia relationships at the first eligible adult 2022 acute-care encounter. ABG denotes $PaCO_2$ ≥45 mm Hg; ABG or VBG denotes $PaCO_2$ ≥45 or $PvCO_2$ ≥50 mm Hg. ICD denotes the five-code composite, including E66.2. The vertical dot-dash line marks BMI 30, the scenario eligibility boundary, not the cohort boundary. Gas curves standardize over outcome-evaluable patients; ICD uses known diagnosis capture. Model/ref N is the common model and reference count. Availability and BMI frequency use all adjustment-complete patients (C); the four frequency groups are mutually exclusive. Adjustment: age, sex, race/ethnicity and region with a fixed natural BMI spline. Shading and fine boundaries show pointwise model-based 95% CIs; dotted segments are locally sparse and dashed segments exceed training BMI support. Open availability points use Wilson intervals when no model is estimable. Known capture is distinct from ICD positivity. ABG/VBG: arterial/venous blood gas. Conditional model uncertainty excludes selection and measurement assumptions; no population transport or causal effect is inferred.

BMI and documented hypercapnia

All valid BMI: primary | encounter-wide

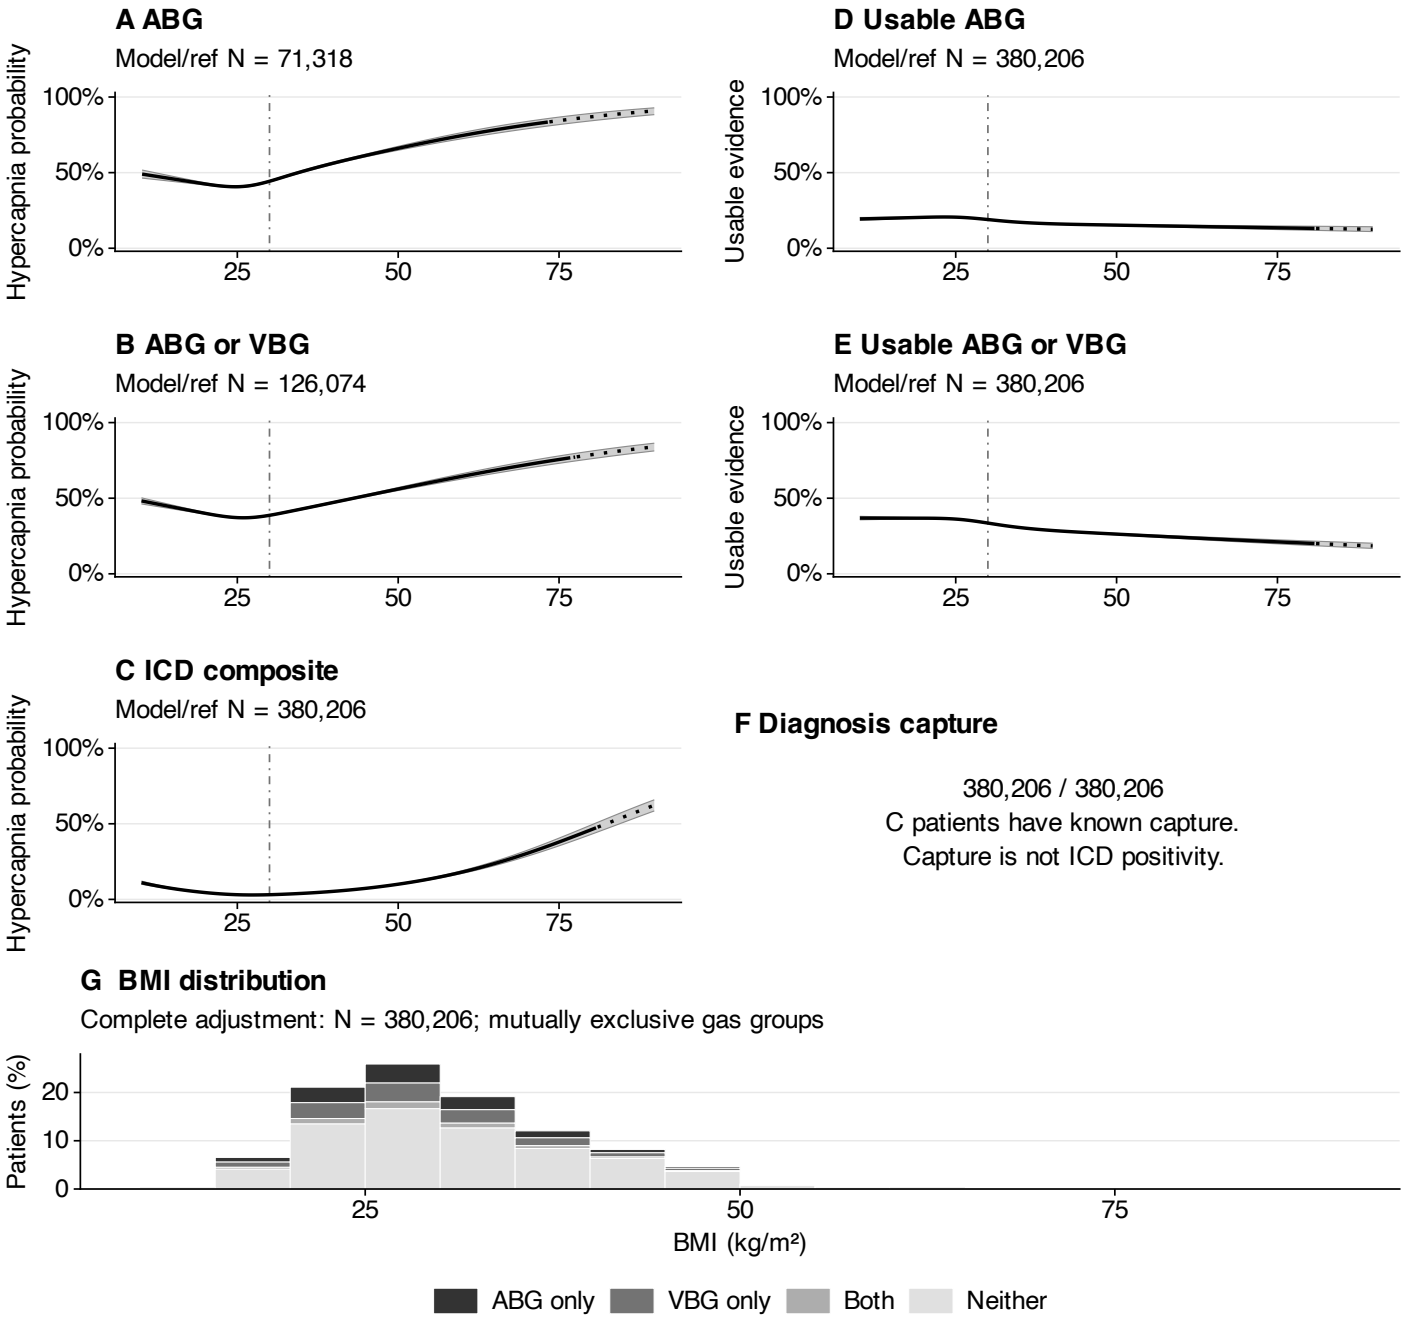

Figure 646: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F1. BMI–hypercapnia relationships at the first eligible adult 2022 acute-care encounter. ABG denotes $PaCO_2$ ≥45 mm Hg; ABG or VBG denotes $PaCO_2$ ≥45 or $PvCO_2$ ≥50 mm Hg. ICD denotes the five-code composite, including E66.2. The vertical dot-dash line marks BMI 30, the scenario eligibility boundary, not the cohort boundary. Gas curves standardize over outcome-evaluable patients; ICD uses known diagnosis capture. Model/ref N is the common model and reference count. Availability and BMI frequency use all adjustment-complete patients (C); the four frequency groups are mutually exclusive. Adjustment: age, sex, race/ethnicity and region with a fixed natural BMI spline. Shading and fine boundaries show pointwise model-based 95% CIs; dotted segments are locally sparse and dashed segments exceed training BMI support. Open availability points use Wilson intervals when no model is estimable. Known capture is distinct from ICD positivity. ABG/VBG: arterial/venous blood gas. Conditional model uncertainty excludes selection and measurement assumptions; no population transport or causal effect is inferred.

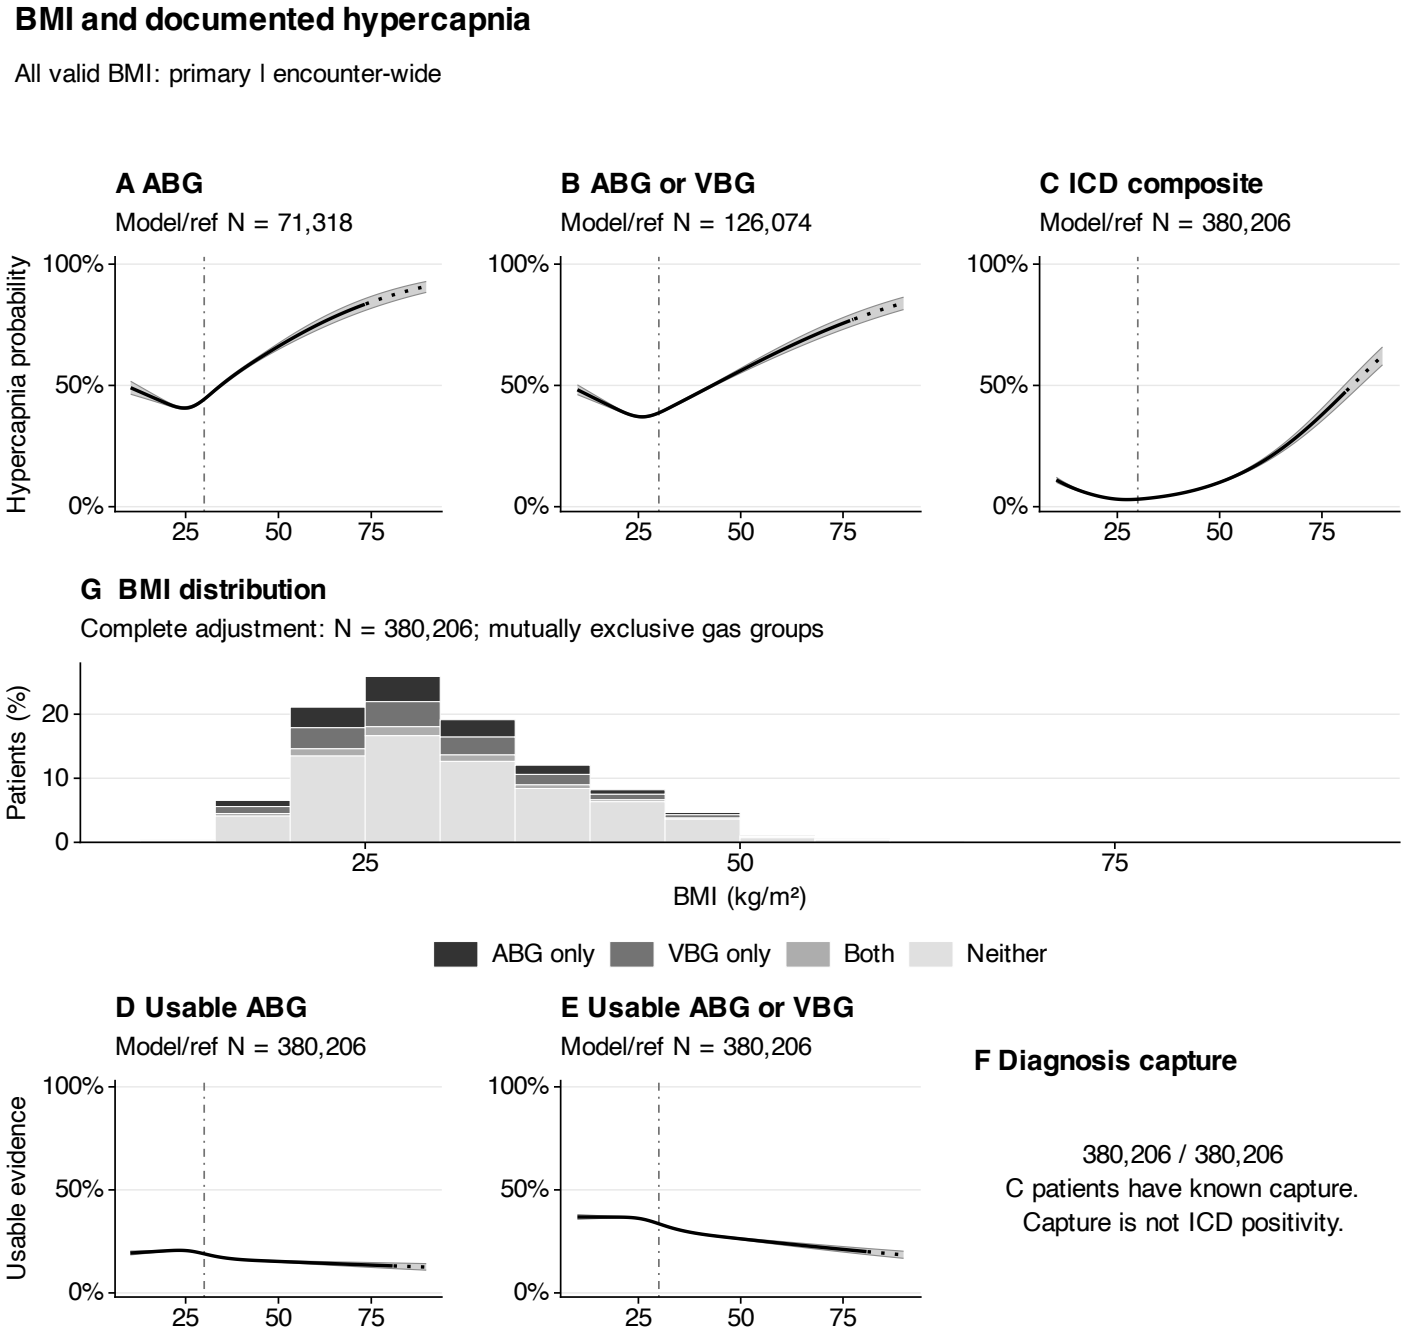

Figure 647: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F1. BMI–hypercapnia relationships at the first eligible adult 2022 acute-care encounter. ABG denotes $PaCO_2$ ≥45 mm Hg; ABG or VBG denotes $PaCO_2$ ≥45 or $PvCO_2$ ≥50 mm Hg. ICD denotes the five-code composite, including E66.2. The vertical dot-dash line marks BMI 30, the scenario eligibility boundary, not the cohort boundary. Gas curves standardize over outcome-evaluable patients; ICD uses known diagnosis capture. Model/ref N is the common model and reference count. Availability and BMI frequency use all adjustment-complete patients (C); the four frequency groups are mutually exclusive. Adjustment: age, sex, race/ethnicity and region with a fixed natural BMI spline. Shading and fine boundaries show pointwise model-based 95% CIs; dotted segments are locally sparse and dashed segments exceed training BMI support. Open availability points use Wilson intervals when no model is estimable. Known capture is distinct from ICD positivity. ABG/VBG: arterial/venous blood gas. Conditional model uncertainty excludes selection and measurement assumptions; no population transport or causal effect is inferred.

One-unit BMI reduction for observed BMI >30; no floor

Paired predictions; original reference and covariates retained

All valid BMI: primary I encounter-wide

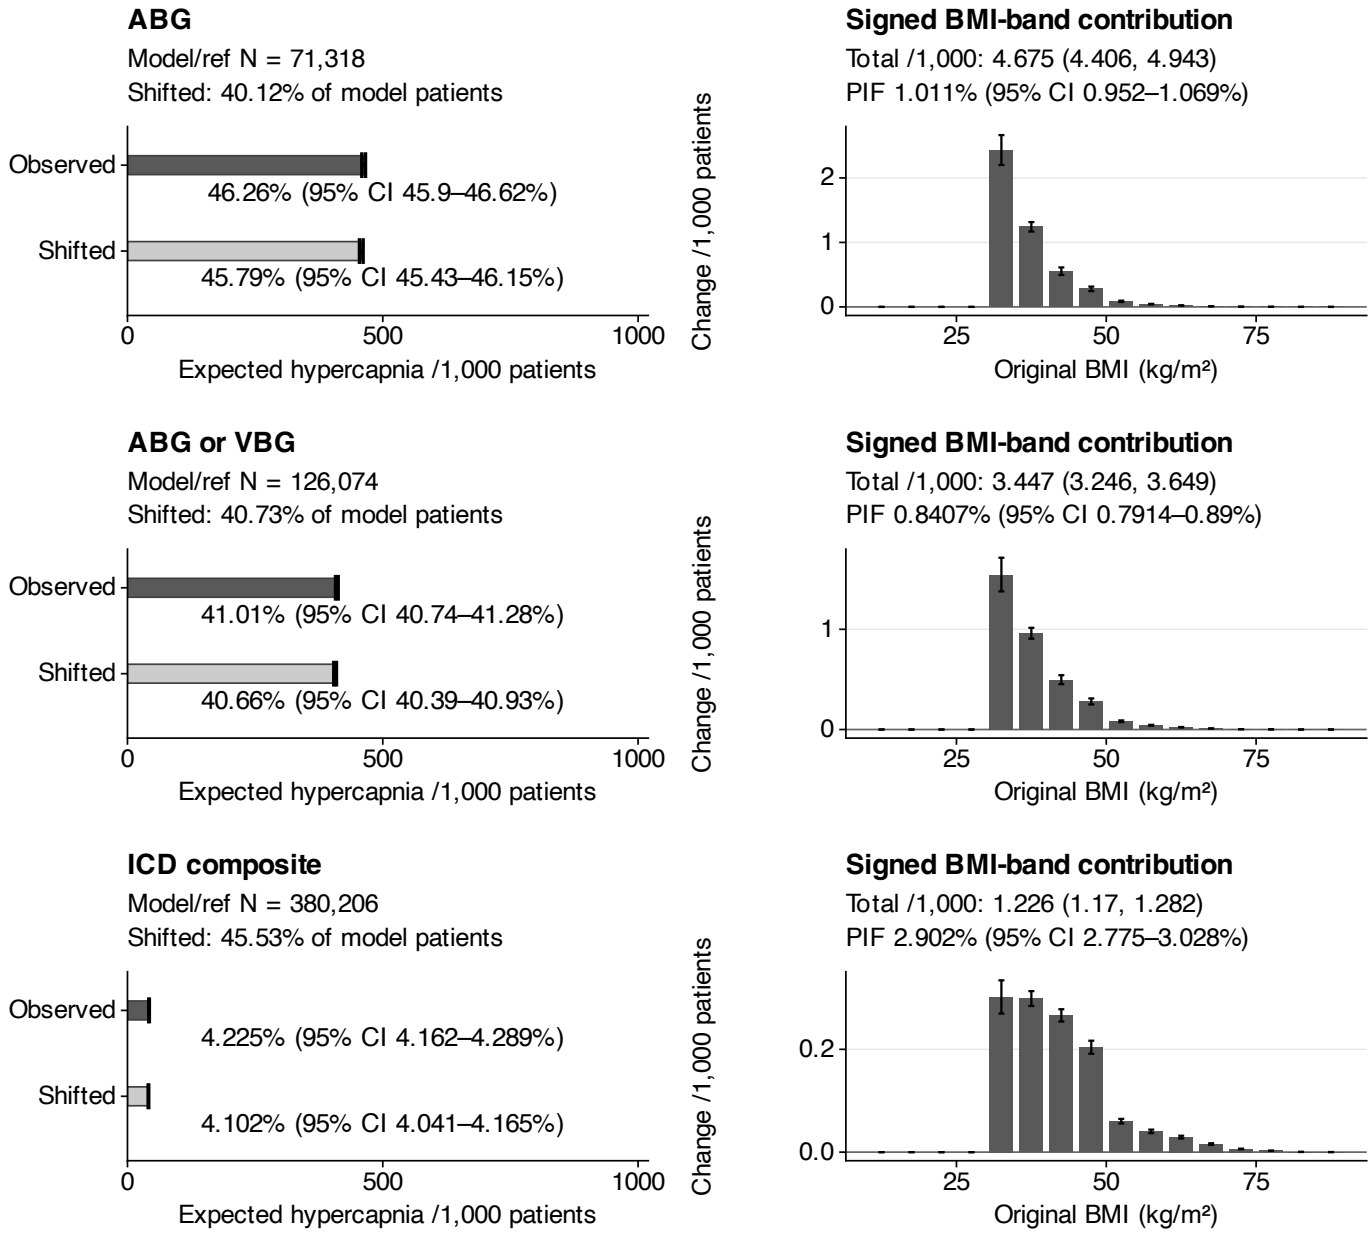

Figure 648: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F2. Paired scenario: One-unit BMI reduction for observed BMI >30; no floor. ABG: arterial PCO_2 ≥45 mm Hg; ABG or VBG: arterial ≥45 or venous ≥50 mm Hg; ICD: five-code composite including E66.2. Left: observed and shifted standardized probabilities with model-based 95% CIs and printed limits. Left axes share the full 0–1,000 reference-patient scale; printed probabilities and limits retain small differences. N identifies the common model/reference population; shifted percentage is a descriptive cohort fraction. Right: signed original-BMI-band contributions per 1,000 reference patients, with 95% CIs. Patients at BMI ≤30 remain in baseline burden and contribute exactly zero scenario difference; the eligible share is printed. Total-difference/PIF limits are printed; contribution covariance reproduces total variance. Right axes vary by outcome and retain zero and all limits. Gas samples are outcome-evaluable; ICD uses known capture. Adjustment, source-entry membership and covariates are fixed. PIF is the model-standardized potential impact fraction. These conditional scenarios do not estimate a weight-loss treatment effect.

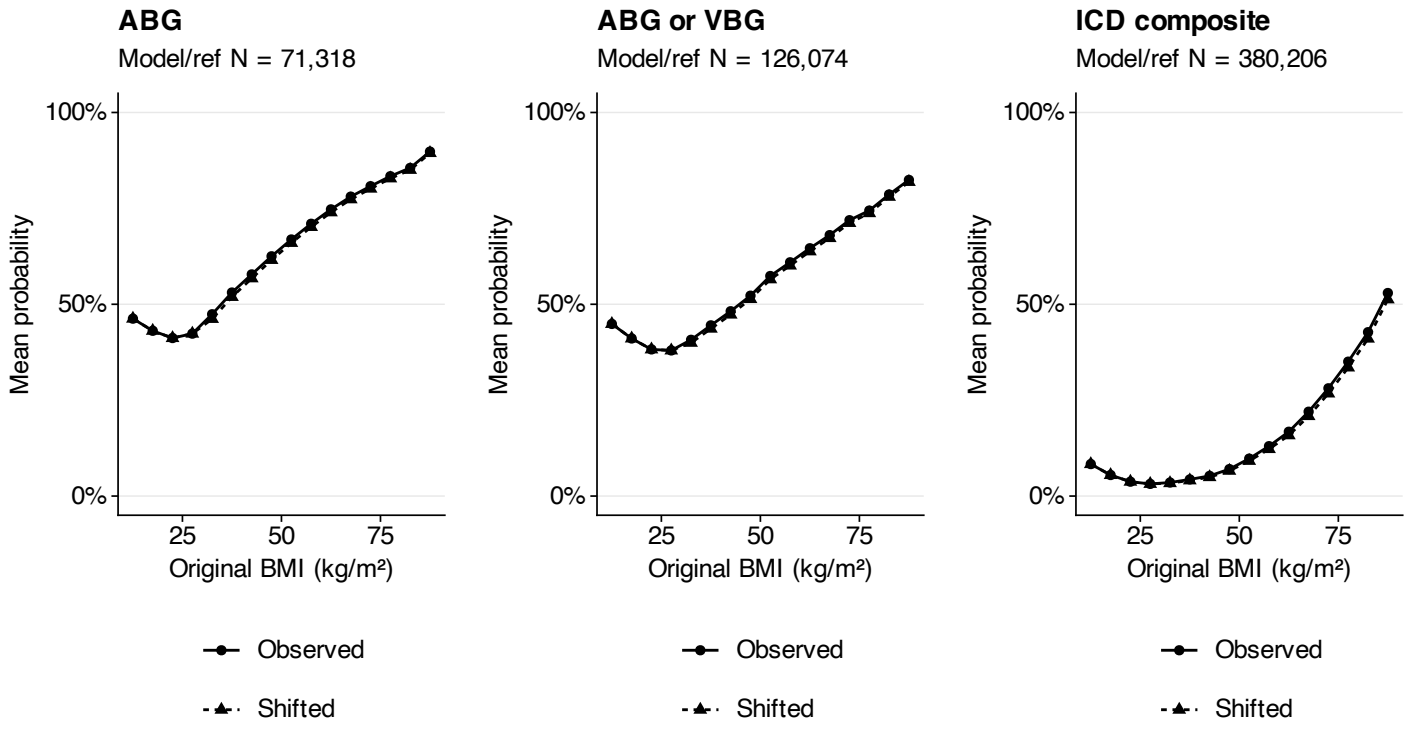

Figure 649: Analysis population: All valid BMI: primary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F2 bands. Mean observed and shifted predictions within each original BMI band; the displayed N is the model/reference population. These are paired conditional predictions, not fixed-BMI risk curves. Band-specific probability intervals are not persisted in the bundle and are not fabricated here; aggregate probability and signed contribution intervals appear in F2. All band means and contribution covariances remain available in the aggregate tables.

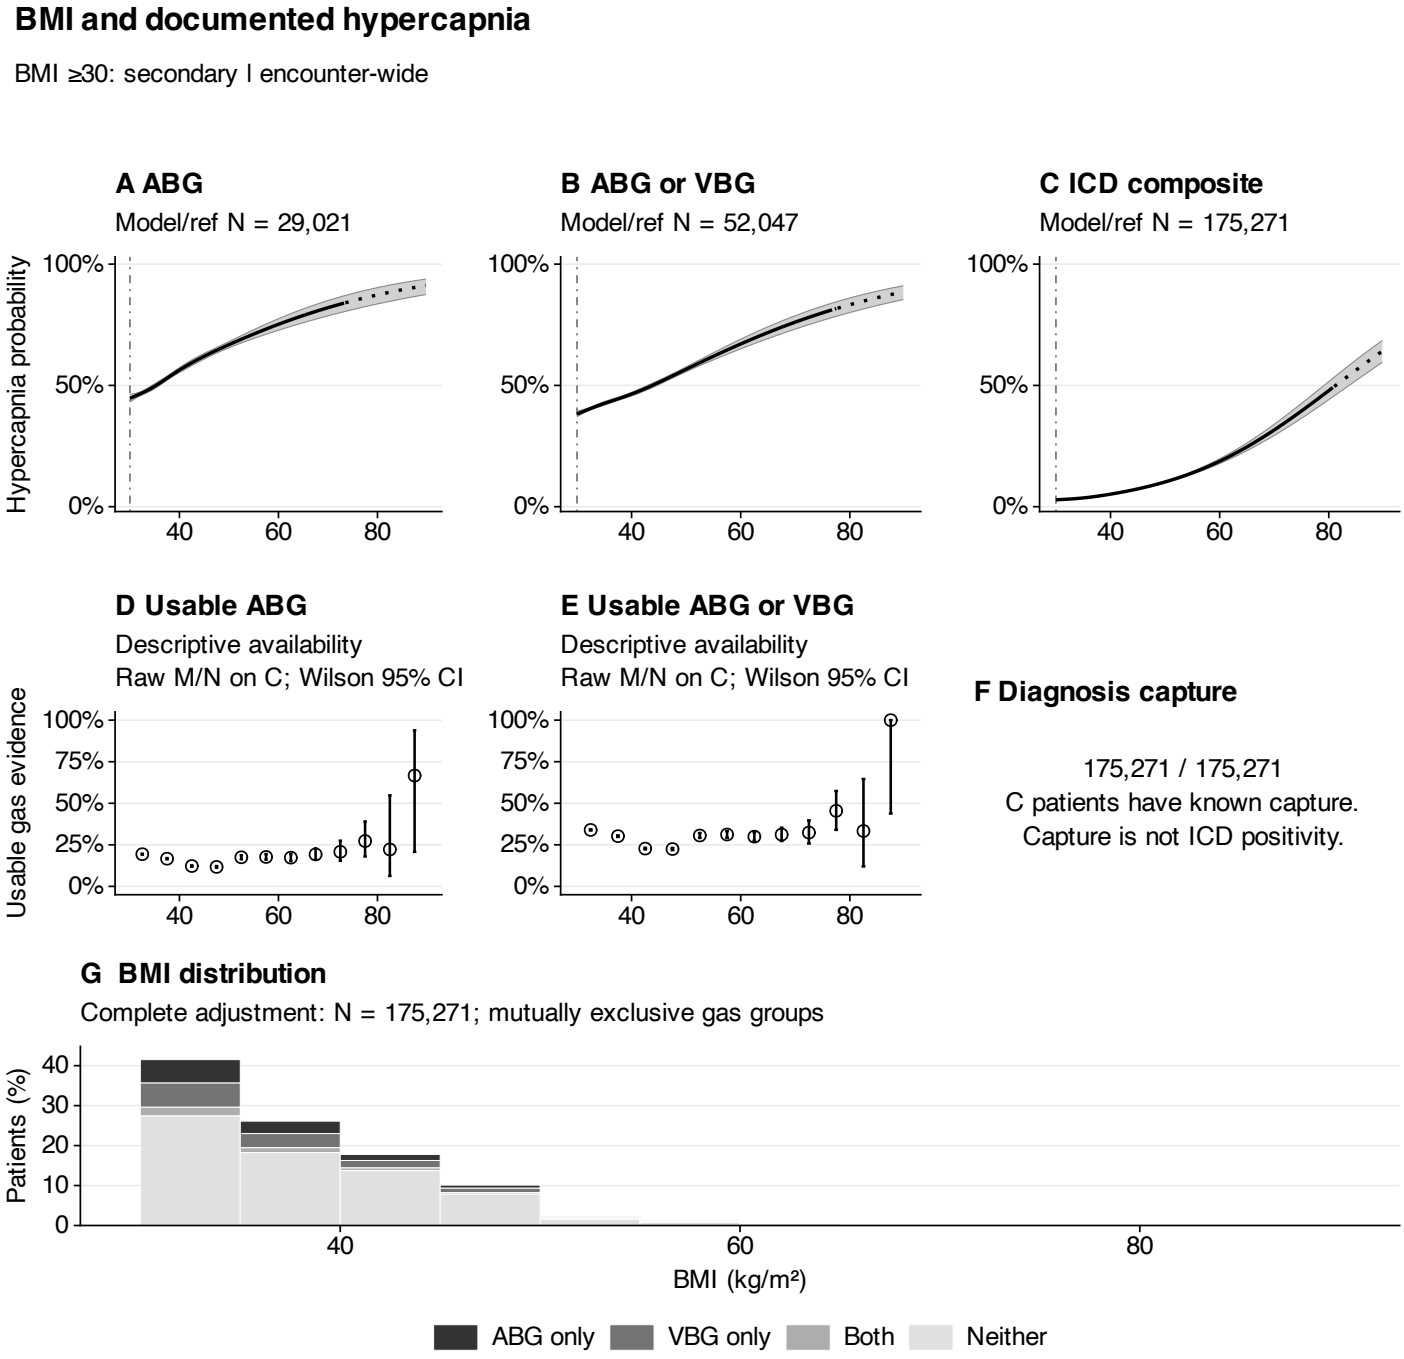

Figure 650: Analysis population: BMI ≥30: secondary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F1. BMI–hypercapnia relationships at the first eligible adult 2022 acute-care encounter. ABG denotes $PaCO_2$ ≥45 mm Hg; ABG or VBG denotes $PaCO_2$ ≥45 or $PvCO_2$ ≥50 mm Hg. ICD denotes the five-code composite, including E66.2. The vertical dot-dash line marks BMI 30, the scenario eligibility boundary and this secondary population's BMI cutoff. Gas curves standardize over outcome-evaluable patients; ICD uses known diagnosis capture. Model/ref N is the common model and reference count. Availability and BMI frequency use all adjustment-complete patients (C); the four frequency groups are mutually exclusive. Adjustment: age, sex, race/ethnicity and region with a fixed natural BMI spline. Shading and fine boundaries show pointwise model-based 95% CIs; dotted segments are locally sparse and dashed segments exceed training BMI support. Open availability points use Wilson intervals when no model is estimable. Known capture is distinct from ICD positivity. ABG/VBG: arterial/venous blood gas. Conditional model uncertainty excludes selection and measurement assumptions; no population transport or causal effect is inferred.

BMI and documented hypercapnia

BMI ≥30: secondary | encounter-wide

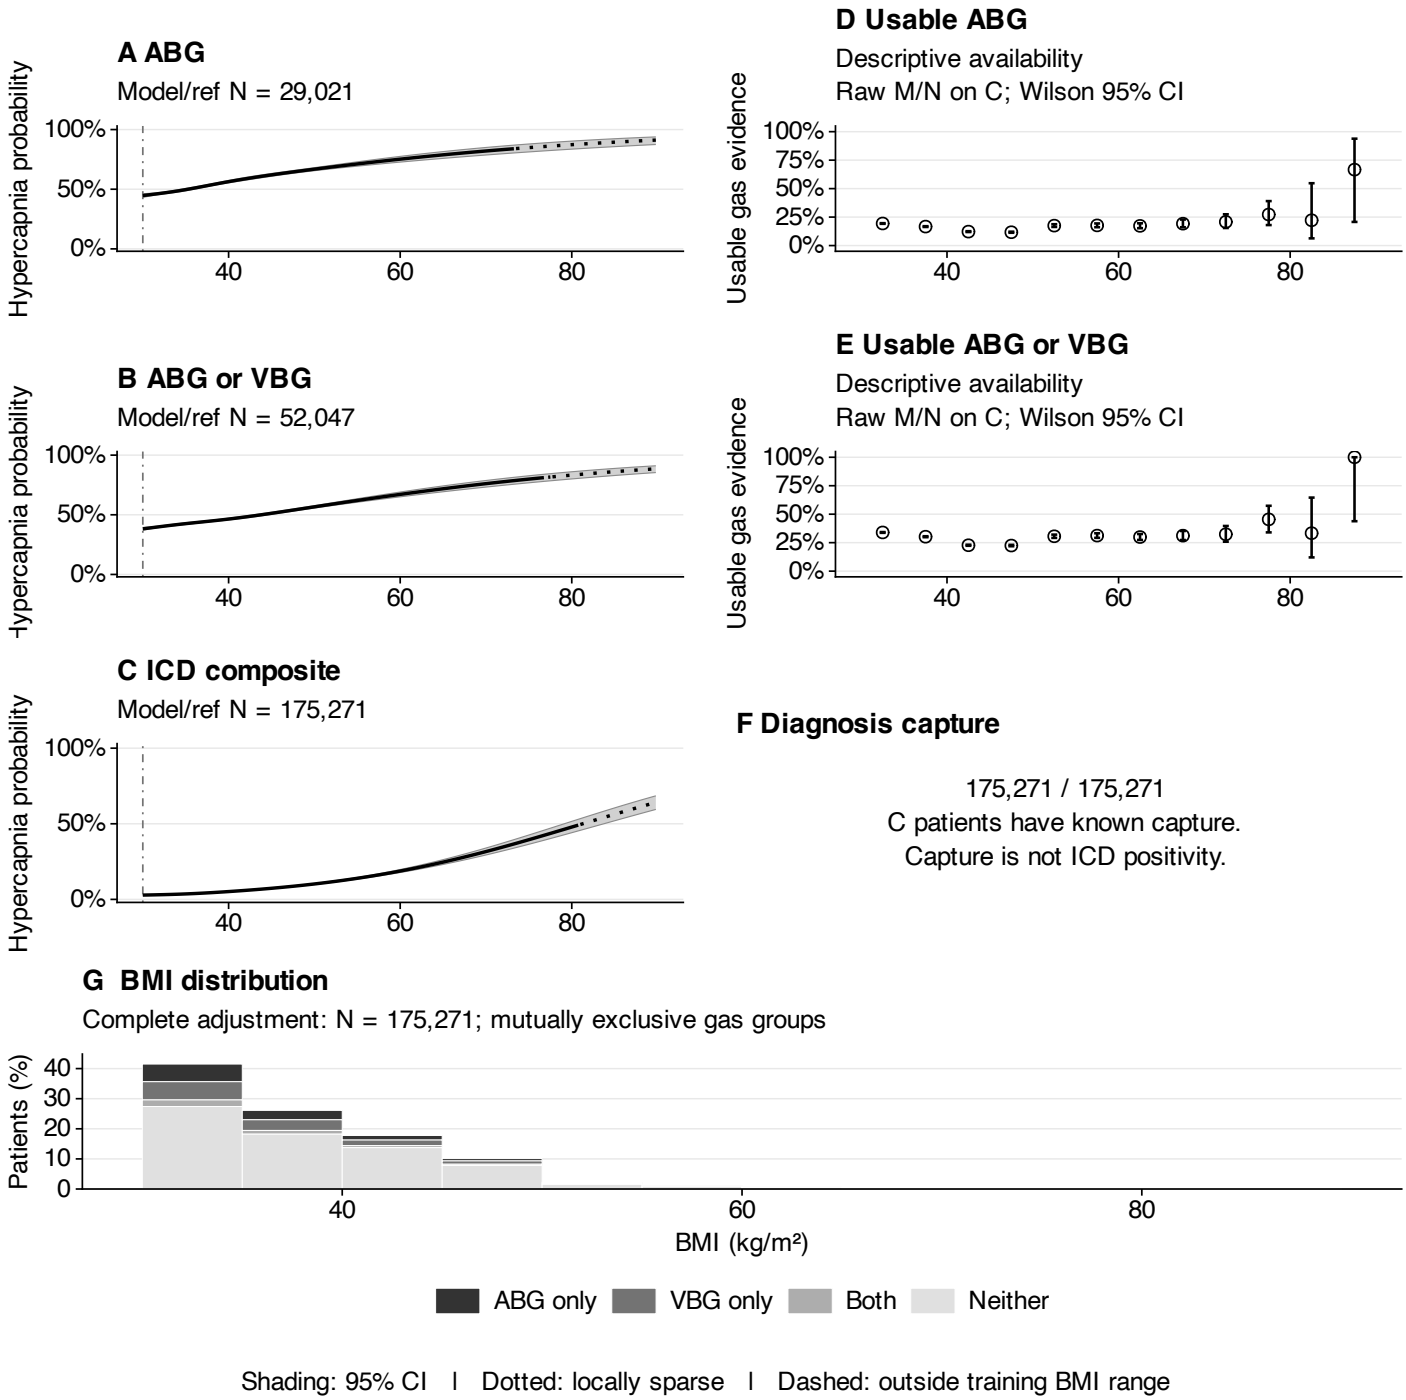

Figure 651: Analysis population: BMI ≥30: secondary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F1. BMI–hypercapnia relationships at the first eligible adult 2022 acute-care encounter. ABG denotes $PaCO_2$ ≥45 mm Hg; ABG or VBG denotes $PaCO_2$ ≥45 or $PvCO_2$ ≥50 mm Hg. ICD denotes the five-code composite, including E66.2. The vertical dot-dash line marks BMI 30, the scenario eligibility boundary and this secondary population's BMI cutoff. Gas curves standardize over outcome-evaluable patients; ICD uses known diagnosis capture. Model/ref N is the common model and reference count. Availability and BMI frequency use all adjustment-complete patients (C); the four frequency groups are mutually exclusive. Adjustment: age, sex, race/ethnicity and region with a fixed natural BMI spline. Shading and fine boundaries show pointwise model-based 95% CIs; dotted segments are locally sparse and dashed segments exceed training BMI support. Open availability points use Wilson intervals when no model is estimable. Known capture is distinct from ICD positivity. ABG/VBG: arterial/venous blood gas. Conditional model uncertainty excludes selection and measurement assumptions; no population transport or causal effect is inferred.

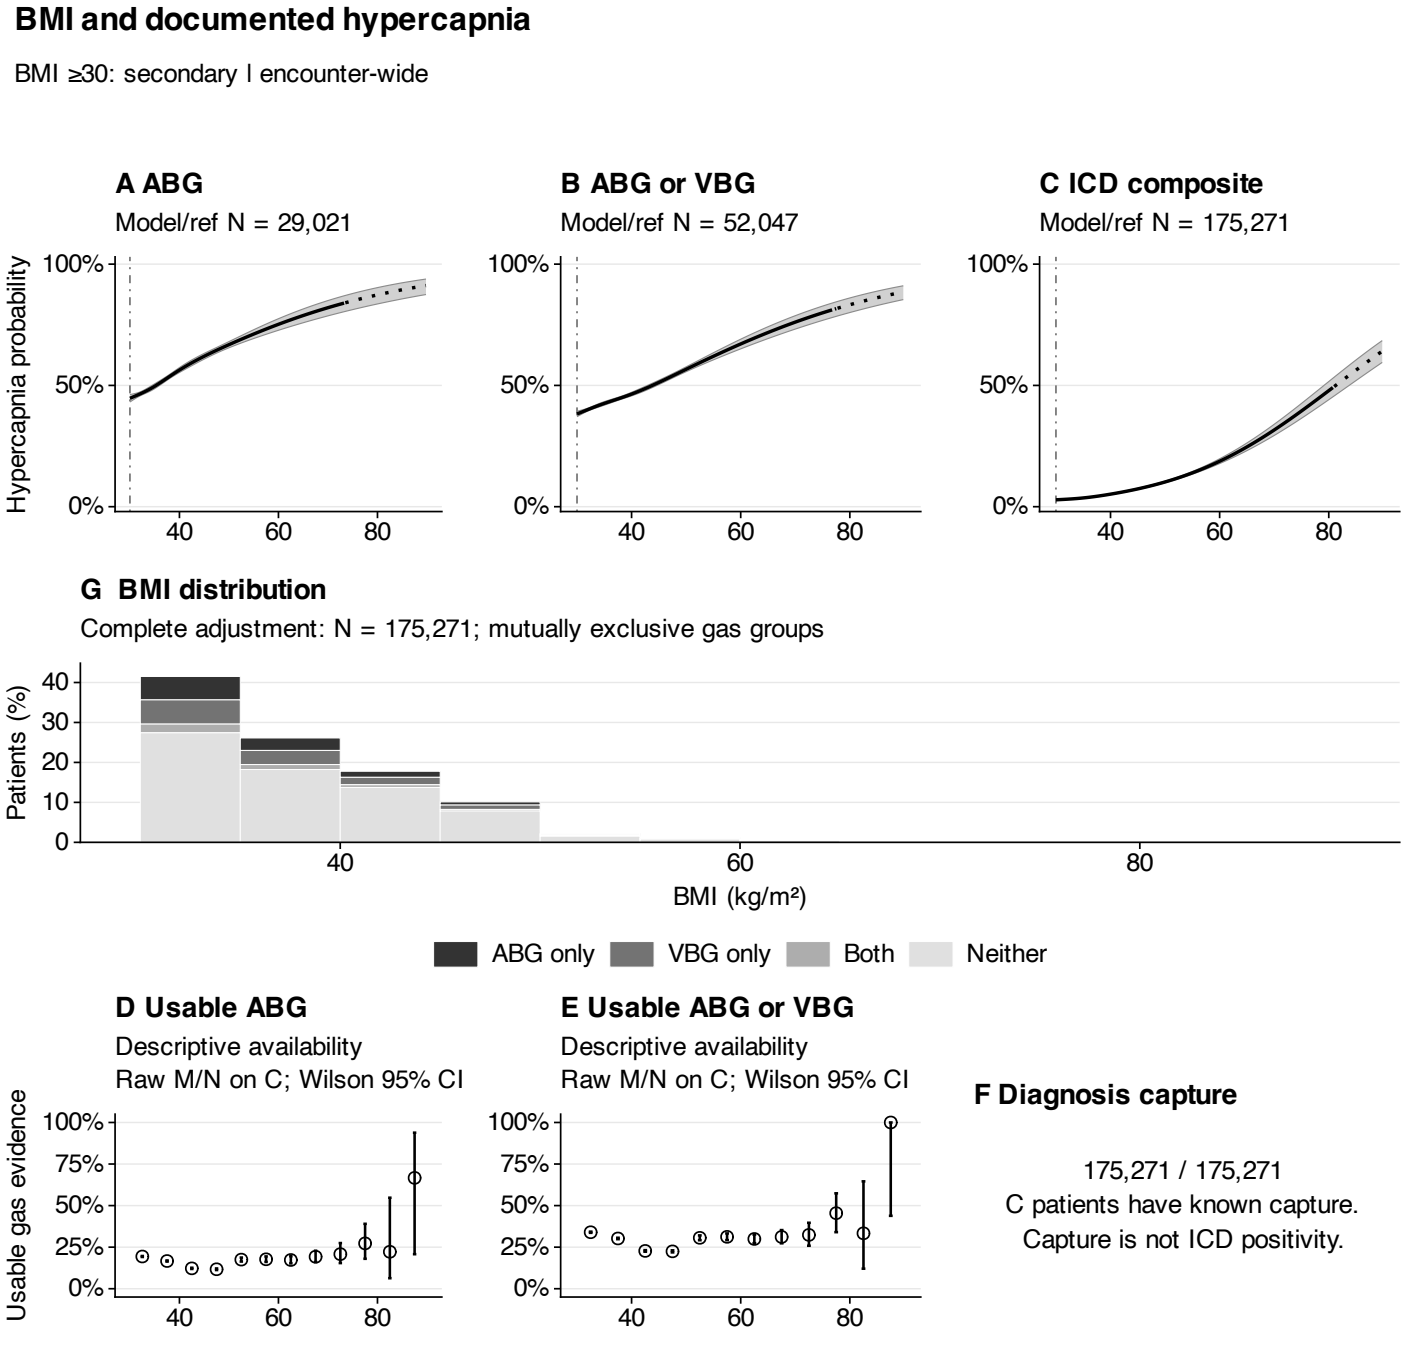

Figure 652: Analysis population: BMI ≥30: secondary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F1. BMI–hypercapnia relationships at the first eligible adult 2022 acute-care encounter. ABG denotes $PaCO_2$ ≥45 mm Hg; ABG or VBG denotes $PaCO_2$ ≥45 or $PvCO_2$ ≥50 mm Hg. ICD denotes the five-code composite, including E66.2. The vertical dot-dash line marks BMI 30, the scenario eligibility boundary and this secondary population's BMI cutoff. Gas curves standardize over outcome-evaluable patients; ICD uses known diagnosis capture. Model/ref N is the common model and reference count. Availability and BMI frequency use all adjustment-complete patients (C); the four frequency groups are mutually exclusive. Adjustment: age, sex, race/ethnicity and region with a fixed natural BMI spline. Shading and fine boundaries show pointwise model-based 95% CIs; dotted segments are locally sparse and dashed segments exceed training BMI support. Open availability points use Wilson intervals when no model is estimable. Known capture is distinct from ICD positivity. ABG/VBG: arterial/venous blood gas. Conditional model uncertainty excludes selection and measurement assumptions; no population transport or causal effect is inferred.

One-unit BMI reduction for observed BMI >30; no floor

Paired predictions; original reference and covariates retained

BMI ≥30: secondary I encounter-wide

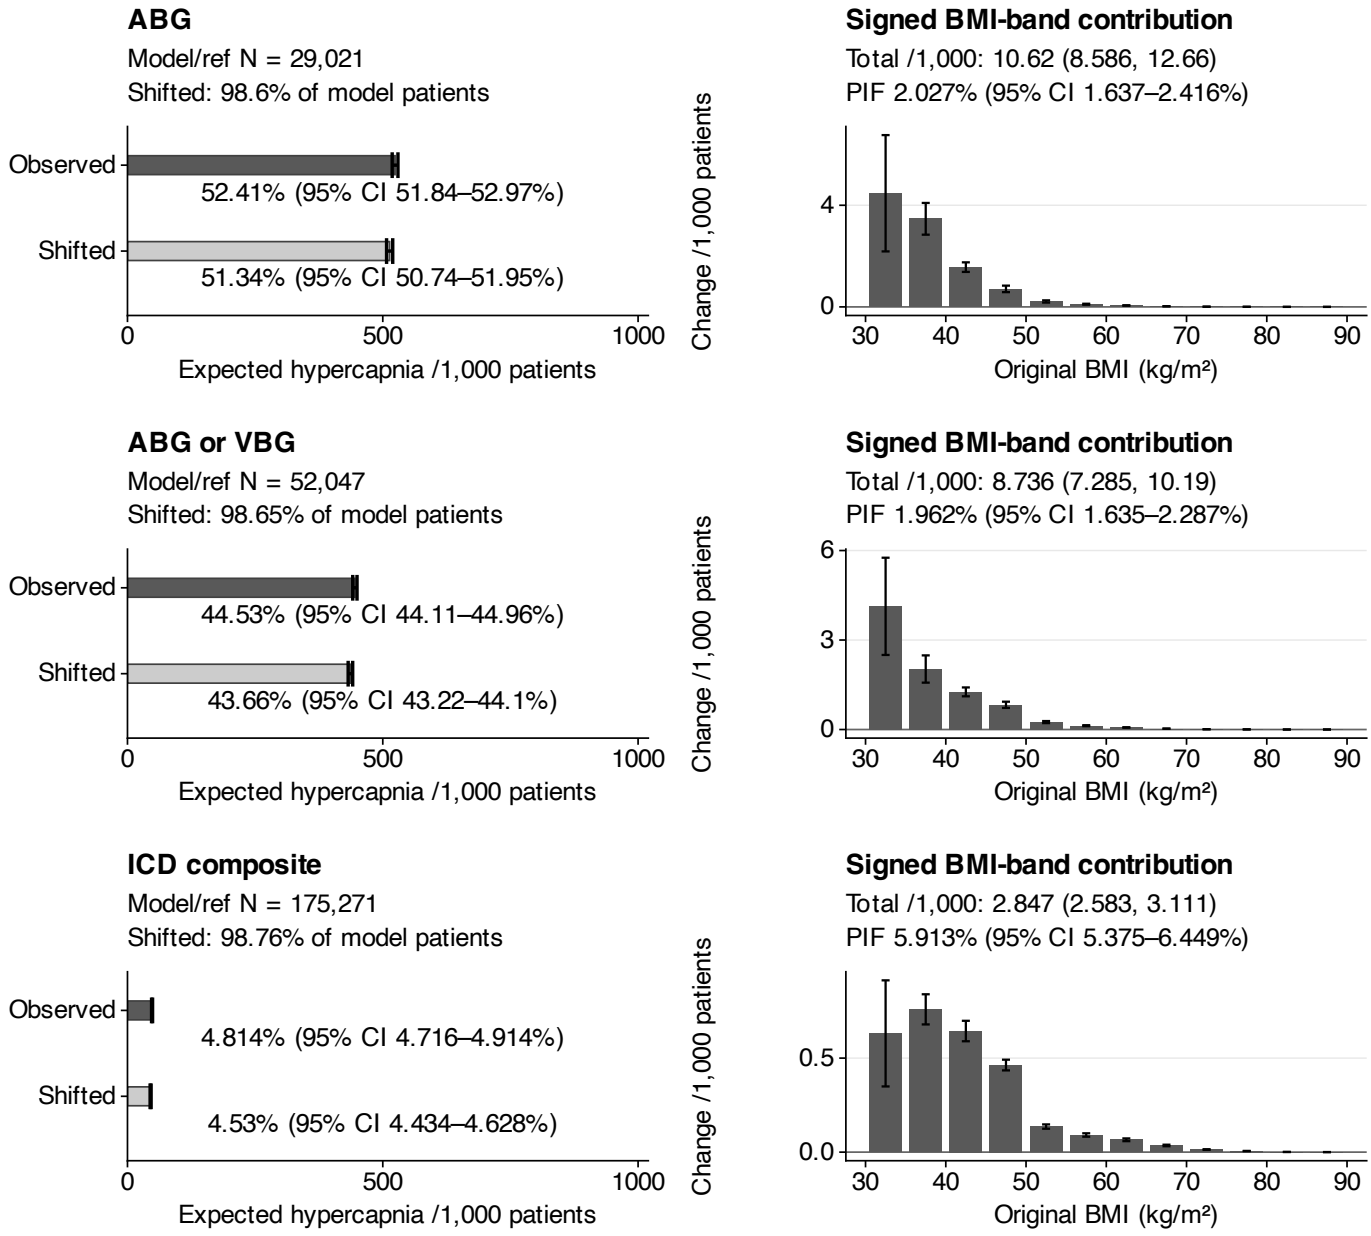

Figure 653: Analysis population: BMI ≥30: secondary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F2. Paired scenario: One-unit BMI reduction for observed BMI >30; no floor. ABG: arterial PCO_2 ≥45 mm Hg; ABG or VBG: arterial ≥45 or venous ≥50 mm Hg; ICD: five-code composite including E66.2. Left: observed and shifted standardized probabilities with model-based 95% CIs and printed limits. Left axes share the full 0–1,000 reference-patient scale; printed probabilities and limits retain small differences. N identifies the common model/reference population; shifted percentage is a descriptive cohort fraction. Right: signed original-BMI-band contributions per 1,000 reference patients, with 95% CIs. Patients at BMI ≤30 remain in baseline burden and contribute exactly zero scenario difference; the eligible share is printed. Total-difference/PIF limits are printed; contribution covariance reproduces total variance. Right axes vary by outcome and retain zero and all limits. Gas samples are outcome-evaluable; ICD uses known capture. Adjustment, source-entry membership and covariates are fixed. PIF is the model-standardized potential impact fraction. These conditional scenarios do not estimate a weight-loss treatment effect.

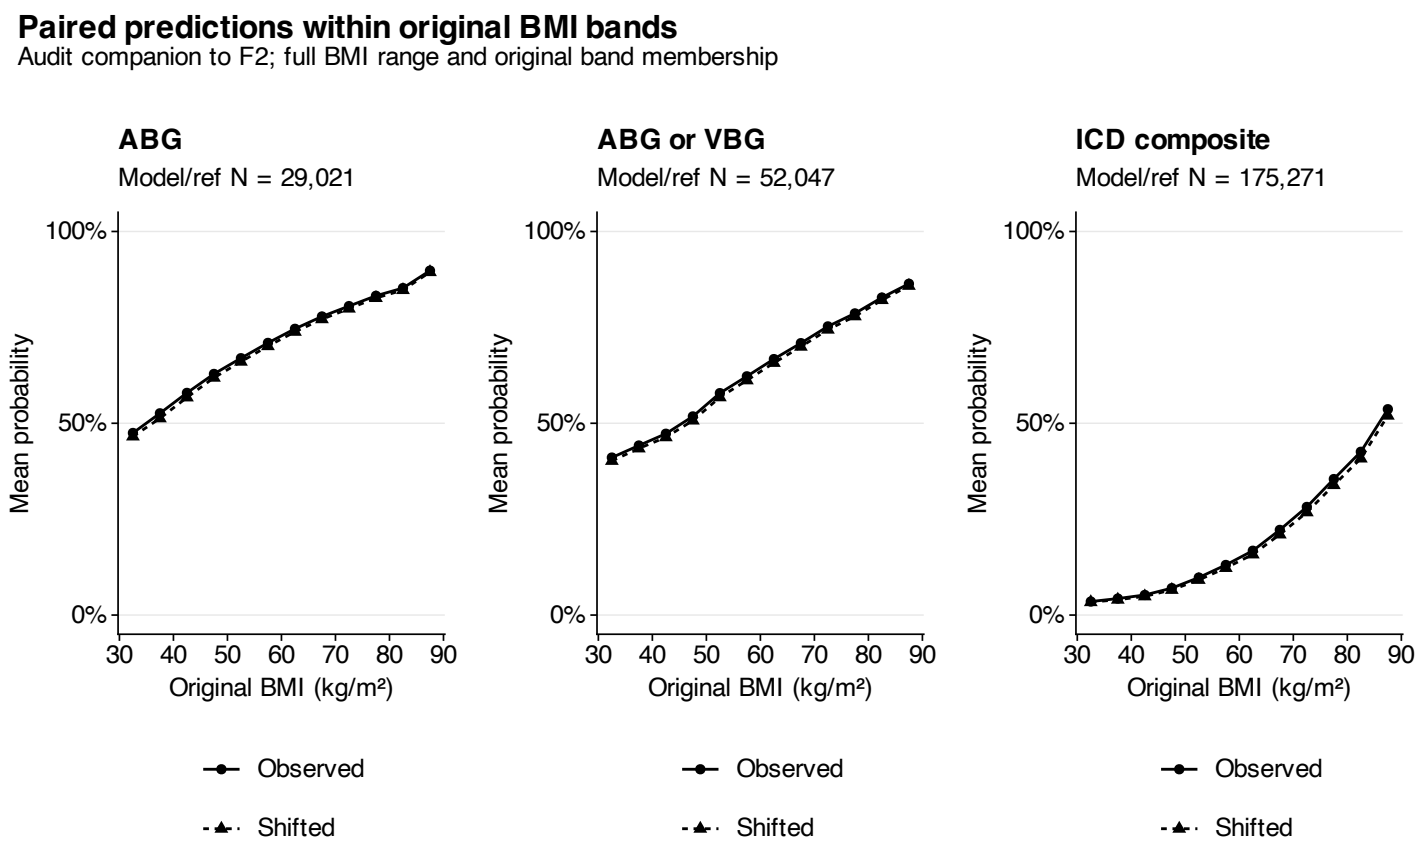

Figure 654: Analysis population: BMI ≥30: secondary. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F2 bands. Mean observed and shifted predictions within each original BMI band; the displayed N is the model/reference population. These are paired conditional predictions, not fixed-BMI risk curves. Band-specific probability intervals are not persisted in the bundle and are not fabricated here; aggregate probability and signed contribution intervals appear in F2. All band means and contribution covariances remain available in the aggregate tables.

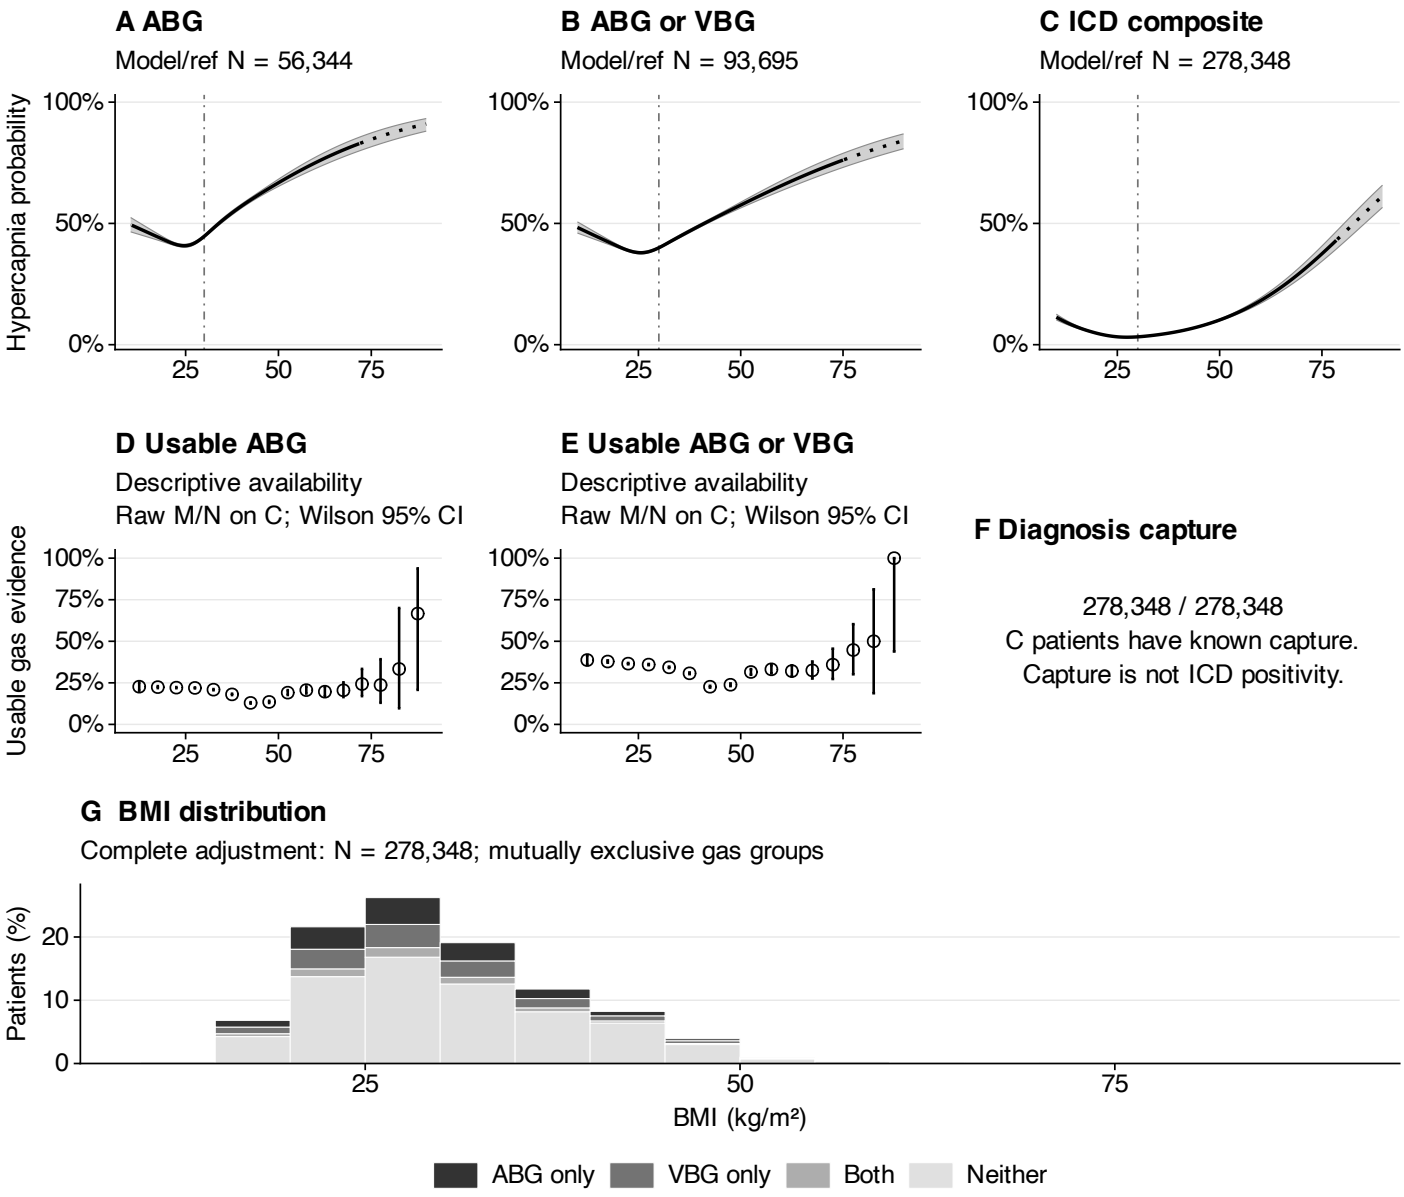

Figure 655: Analysis population: Current BMI: sensitivity. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F1. BMI–hypercapnia relationships at the first eligible adult 2022 acute-care encounter. ABG denotes $PaCO_2$ ≥45 mm Hg; ABG or VBG denotes $PaCO_2$ ≥45 or $PvCO_2$ ≥50 mm Hg. ICD denotes the five-code composite, including E66.2. The vertical dot-dash line marks BMI 30, the scenario eligibility boundary, not the cohort boundary. Gas curves standardize over outcome-evaluable patients; ICD uses known diagnosis capture. Model/ref N is the common model and reference count. Availability and BMI frequency use all adjustment-complete patients (C); the four frequency groups are mutually exclusive. Adjustment: age, sex, race/ethnicity and region with a fixed natural BMI spline. Figure 665: Analysis population: All OBESITY routes: overlapping sensitivity. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F5. Matched ICD/gas curves use identical training/reference patients within each pair and shared BMI/probability scales. Arterial and combined pairs can have different membership. Bands are pointwise model-based 95% CIs; dotted segments are locally sparse and dashed segments exceed training BMI support. ICD is the five-code composite including E66.2. Separate bands are not a test of between-model differences.

Figure 667: Analysis population: All OBESITY routes: overlapping sensitivity. Subgroup accounting begins with fixed indexes; source/input nodes in these subgroup views do not repeat upstream selection. F5. Encounter versus encounter-start-calendar-day curves reuse the same indexes and fixed spline basis, on shared BMI/probability scales. Each curve standardizes over its displayed model/reference population. Bands are pointwise model-based 95% CIs; dotted segments are locally sparse and dashed segments exceed training BMI support. Pending source or failed models remain explicit. Index day is a calendar-date restriction, not elapsed 24 hours.

6 Export and review record

The immutable bundle contains all tables, configuration, source hashes and input receipt. Figures and reports are fresh views of that bundle. Rendering is guarded against clinical input reads and model refits. Consult the adjacent render receipt, figure manifest and actual visual-review receipt for checks performed; successful rendering does not establish source or scientific acceptance.
